FOR IMMEDIATE RELEASE

### **New Trane Voyager™ Rooftop Units Deliver Superior Energy Efficiency, Life Cycle Performance**

**Brussels, Belgium, January 28, 2010** – New Trane Voyager™ rooftop units are now available, bringing increased energy efficiency and reliability to supermarkets, movie theatres, warehouses and other commercial and industrial buildings in Europe, Africa and the Middle East. The easy to install systems replace the existing Voyager rooftop unit line.

The 15-165 kW packaged units offer a choice of cooling-only, gas-fired, heat pump or dual fuel technologies to meet specific customer cooling and heating needs. Additional energy-saving options such as plate heat exchanger, heat wheel, adjustable fresh air volume and free-cooling are also available.

The new Voyager rooftop units are Eurovent-certified (class A efficiency for a number of units) with a high Coefficient of Performance (COP) and Energy Efficiency Rating (EER). Additional energy savings can be achieved with technologies such as heat recovery and a modulating and condensing gas burner.

The Voyager's high efficiency makes it particularly suitable for cold chain and storage applications, such as chocolate and flower storage. The new design allows the units to perform in extremely warm or very cold environments.

Its "plug and play" design, with a single-point power connection and factory-installed accessories, ensures easy installation and commissioning. Comfort, operation, safety and accessibility are improved as a result of a complete redesign of the structure.

"Trane Voyager systems combine high reliability and energy savings, easier installation and less maintenance to deliver reduced cost of ownership," said Pierre Cazal, vice president equipment systems for Trane commercial business in Europe, Middle East, Africa and India. "This flexible system ensures seamless integration with building management systems to improve customers' heating, ventilating and air conditioning system performance."
