Product Catalog

Ascend™ Air-Cooled Chiller — Model ACS
140 to 230 Nominal Tons
Introduction

Design and manufacturing excellence makes Trane a leader in the air-cooled chiller marketplace. This tradition of using excellence to meet market demands is illustrated with the Trane Ascend™ line of air-cooled chiller. This chiller is an exciting step forward in energy efficiency, sound, reliability, ease of serviceability, control precision, application versatility, and operational cost-effectiveness. The chiller is designed to deliver proven Trane performance and reliability.

Revision History

- Corrected unit model number digits 9 and 32.
- Updated low and wide ambient lower limit to -20°F (-29°C)
- Corrected the following in General Data tables:
  - (I-P) row descriptions for Pump Package (twin pump)
  - Pump package available head pressure
  - Power per fan motor
  - Refrigerant and oil charge information
  - Ambient range information
- Updated electrical data.
- Updated Electrical Connections drawings.
- Update dimensional data for units with pump package option.
- Updated pump package option information.

Features and Benefits

Reliability

- Years of laboratory testing, including running the chiller at extreme operating conditions, have resulted in optimized compressor and chiller systems reliability by confirming a robust design and verifying quality each step of the way.
- Direct-drive, low-speed scroll compressors with intermediate discharge valve to increase seasonal efficiency. Suction gas-cooled motor stays at a uniformly low temperature for long motor life.
- Powered by UC800 industry-leading control algorithms — Enhanced flow management provides unmatched system performance in variable flow water systems.
- Standard factory-installed water strainer helps prevent system debris from affecting unit flow or heat transfer.
- Flow switch is factory-installed at the optimum location in the piping for reduced chiller installation cost and superior flow sensing, reducing the potential for nuisance trips.
- Microchannel condenser uses all-aluminum coils with fully-brazed construction. This design reduces risk of leaks. Their flat streamlined tubes with small ports and metallurgical tube-to-fin bond enable exceptional heat transfer and dramatic reduction in refrigerant use.
- Variable speed permanent magnet motors on ALL condenser fans for increased efficiency and lower sound.

Life Cycle Cost-Effectiveness

- Optimized for part load performance.
- Scroll compressors with intermediate discharge valve to increase seasonal efficiency.
- Optional pump package features variable speed drive on the pump motors, eliminating the need for energy sapping chilled water system triple-duty or balancing valves. Additionally, system commissioning and flexibility is greatly enhanced. Chilled water supply reliability is increased with the dual pump design, due to standard failure/recovery functionality.

Application Versatility

- Low temperature process cooling - Excellent operating temperature range and precise control capabilities enable tight control.
- Thermal energy storage - Utilities and owners benefit from reduced cooling energy cost. The AquaStream chiller’s dual setpoint control and industry leading energy storage efficiency assures reliable operation and superior system efficiency. Trane’s partnership with CALMAC® brings a proven track record of successful installations across many markets; from churches and schools to skyscrapers and office buildings.

Simple, Economical Installation

- Compressor sound attenuation, variable speed fans, and night noise setback help reduce sound levels, making it the perfect solution for chiller installation in a neighborhood.
- System integration available with LonTalk®, ModBus™, or BACnet® through a single twisted-pair wire for a less expensive translation to an existing building automation system.
- Powder-coated paint provides superior durability, corrosion protection, and is less likely to be damaged while rigging/lifting/installing the chiller.
- Factory commissioned unit-mounted starter reduces overall job cost and improves system reliability by eliminating job site design, installation and labor coordination requirements.

Precision Control

- 7-inch color touch screen display with graphics
Features and Benefits

- Powered by UC800 industry-leading control algorithms — Enhanced flow management provides unmatched system performance in variable flow water systems
- Adaptive Control™ keeps the chiller running in extreme conditions
  - Tight set point control
  - Graphical trending
  - Maximized chiller update
- BACnet®, Modbus™, LonTalk®, communications protocol interface available without the need for gateways
- Optional condenser fan speed control to help meet preset nighttime sound requirements

Improved Serviceability

- All major serviceable components are close to the edge. Service shutoff valves and water strainer are conveniently located to enable easy service.
- Full on-site serviceability
- Electronic expansion valve designed so controls can be removed and serviced without refrigerant handling.
Application Considerations

Certain application constraints should be considered when sizing, selecting, and installing Trane chillers. Unit and system reliability is often dependent on properly and completely complying with these considerations. When the application varies from the guidelines presented, it should be reviewed with your local sales engineer.

*Note: The terms water and solution are used interchangeably in the following paragraphs.*

Unit Sizing

See TOPSS™ performance selection software for unit capacities. Intentionally oversizing a unit to ensure adequate capacity is not recommended. Erratic system operation and excessive compressor cycling are often a direct result of an oversized chiller. In addition, an oversized unit is usually more expensive to purchase, install, and operate. If oversizing is desired, consider using two units.

Water Treatment

The use of untreated or improperly treated water may result in scaling, erosion, corrosion, and algae or slime buildup. This will adversely affect heat transfer between the water and system components. Proper water treatment must be determined locally and depends on the type of system and local water characteristics.

Neither salt nor brackish water is recommended for use in Trane air-cooled chillers. Use of either will lead to a shortened life. Trane encourages the employment of a qualified water treatment specialist, familiar with local water conditions, to assist in the establishment of a proper water treatment program.

Foreign matter in the chilled water system can also increase pressure drop and, consequently, reduce water flow. For this reason it is important to thoroughly flush all water piping to the unit before making the final piping connections to the unit.

Effect of Altitude on Capacity

At elevations substantially above sea level, the decreased air density will decrease condenser capacity and, therefore, unit capacity and efficiency.

Ambient Limitations

Trane chillers are designed for year-round operation over a range of ambient temperatures.

- **Standard Ambient Range** = 32 to 115°F (0 to 46°C)
- **Low Ambient Range** = -20 to 115°F (-29 to 46°C)
- **High Ambient Range** = 32 to 130°F (0 to 54.4°C)
- **Wide Ambient Range** = -20 to 130°F (-29 to 54.4°C)

Operation below 32°F requires the use of variable speed fans unless otherwise specified. The minimum ambient temperatures are based on still conditions (winds not exceeding five mph). Greater wind speeds will result in a drop in head pressure, therefore increasing the minimum starting and operating ambient temperature. The Adaptive Control™ microprocessor will attempt to keep the chiller on-line when high or low ambient conditions exist, making every effort to avoid nuisance trip-outs and provide the maximum allowable tonnage.

Water Flow Limits

The minimum water flow rates are given in the General Data chapter of this catalog. Evaporator flow rates below the tabulated values will result in laminar flow causing freeze-up problems, scaling, stratification and poor control.
Application Considerations

The maximum evaporator water flow rate is also given in General Data. Flow rates exceeding those listed may result in very high pressure drop across the evaporator and/or excessive tube erosion.

**Note:** Flow rates in the general data tables are for water only. They do not include freeze inhibitors.

### Flow Rates Out of Range

Many process cooling jobs require flow rates that cannot be met with the minimum and maximum published values within the evaporator. A simple piping change can alleviate this problem. For example: a plastic injection molding process requires 80 gpm (5.0 l/s) of 50°F (10°C) water and returns that water at 60°F (15.6°C). The selected chiller can operate at these temperatures, but has a minimum flow rate of 106 gpm (6.6 l/s). The system layout in the figure below can satisfy the process.

**Figure 1. Flow rate out of range systems solution**

![Flow rate out of range systems solution diagram]

**Flow Proving**

Trane provides a factory-installed water flow switch monitored by UC800 which protects the chiller from operating in loss of flow conditions.

### Variable Flow in the Evaporator

Variable Primary Flow (VPF) systems present building owners with several cost-saving benefits when compared with Primary/Secondary chilled water systems. The most obvious cost savings results from eliminating the constant volume chiller pump(s), which in turn eliminates the related expenses of the associated piping connections (material, labor), and electrical service and switch gear. In addition to the installed cost advantage, building owners often cite pump related energy savings as the reasons that prompted them to select a VPF system.

The chiller is capable of handling variable evaporator flow without losing control of the leaving water temperature. The microprocessor and capacity control algorithms are designed to handle a 10 percent change in water flow rate per minute while maintaining a ±2°F (1.1°C) leaving water temperature control accuracy. The chiller tolerates up to 30 percent per minute water flow variation as long as the flow is equal or above the minimum flow rate requirement.

With the help of a software analysis tool such as System Analyzer™, DOE-2 or TRACE™, anticipated energy savings can be determined, and used to justify variable primary flow in a particular application. Existing constant flow chilled water systems may be relatively easily converted to VPF and benefit greatly from the inherent efficiency advantages.

### Water Temperature

#### Leaving Water Temperature Limits

Trane chillers have distinct leaving water categories:
• Standard, with a leaving solution range of 40 to 68°F (5.5 to 20°C)
• Low temperature process cooling, with leaving solution less than 40°F (4.4°C)
• Ice-making, with leaving solution less than 40°F

Since leaving solution temperatures below 40°F (4.4°C) result in suction temperature at or below the freezing point of water, a glycol solution is required for all low temperature and ice-making machines. Ice making control includes dual setpoints and safeties for ice making and standard cooling capabilities. Consult your local Trane account manager for applications or selections involving low temperature or ice making machines.

The maximum water temperature that can be circulated through the evaporator when the unit is not operating is 125°F (52°C). Evaporator damage may result above this temperature.

### Leaving Water Temperature Out of Range

Many process cooling jobs require temperature ranges that cannot be met with the minimum and maximum published values for the chiller. A simple piping change can alleviate this problem. For example, a laboratory load requires 238 gpm (15 l/s) of water entering the process at 86°F (30°C) and returning at 95°F (35°C). The chiller’s maximum leaving chilled water temperature of 68°F (20°C) prevents direct supply to the load. In the example shown, both the chiller and process flow rates are equal, however, this is not necessary. For example, if the chiller had a higher flow rate, there would be more water bypassing and mixing with warm water returning to the chiller.

**Figure 2. Temperature out of range system solution**

![Temperature out of range system solution](image)

### Supply Water Temperature Drop

The cataloged performance data for the chiller is based on a chilled water temperature drop of 10°F (6°C) for I-P data and 9°F (5°C) for SI data. Full load chilled water temperature drops from 6 to 18°F (3.3 to 10°C) may be used as long as minimum and maximum water temperature and minimum and maximum flow rates are not exceeded. Temperature drops outside this range at full load conditions are beyond the optimum range for control and may adversely affect the microcomputer’s ability to maintain an acceptable supply water temperature range. Furthermore, full load temperature drops of less than 6°F (3.3°C) may result in inadequate refrigerant superheat which is critical to long term efficient and reliable operation. Sufficient superheat is always a primary concern in any refrigerant system and is especially important in a packaged chiller where the evaporator is closely coupled to the compressor.

### Typical Water Piping

All building water piping must be flushed prior to making final connections to the chiller. To reduce heat loss and prevent condensation, insulation should be applied. Expansion tanks are also usually required so that chilled water volume changes can be accommodated.
Application Considerations

Avoidance of Short Water Loops

Adequate chilled water system water volume is an important system design parameter because it provides for stable chilled water temperature control and helps limit unacceptable short cycling of chiller compressors.

The chiller’s temperature control sensor is located in the supply (outlet) water connection or pipe. This location allows the building to act as a buffer to slow the rate of change of the system water temperature. If there is not a sufficient volume of water in the system to provide an adequate buffer, temperature control can suffer, resulting in erratic system operation and excessive compressor cycling.

Typically, a two-minute water loop circulation time is sufficient to prevent short water loop issues. Therefore, as a guideline, ensure the volume of water in the chilled water loop equals or exceeds two times the evaporator flow rate. For systems with a rapidly changing load profile the amount of volume should be increased.

If the installed system volume does not meet the above recommendations, the following items should be given careful consideration to increase the volume of water in the system and, therefore, reduce the rate of change of the return water temperature.

- A volume buffer tank located in the return water piping.
- Larger system supply and return header piping (which also reduces system pressure drop and pump energy use).

Minimum Water Volume for a Process Application

If a chiller is attached to an on/off load such as a process load, it may be difficult for the controller to respond quickly enough to the very rapid change in return solution temperature if the system has only the minimum water volume recommended. Such systems may cause chiller low temperature safety trips or in the extreme case evaporator freezing. In this case, it may be necessary to add or increase the size of the mixing tank in the return line.

Multiple Unit Operation

Whenever two or more units are used on one chilled water loop, Trane recommends that their operation be coordinated with a higher level system controller for optimum system efficiency and reliability. The Trane Tracer® system has advanced chilled plant control capabilities designed to provide such operation.

Ice Storage Operation

An ice storage system uses the chiller to make ice at night when utilities generate electricity more efficiently with lower demand and energy charges. The stored ice reduces or even replaces mechanical cooling during the day when utility rates are at their highest. This reduced need for cooling results in significant utility cost savings and source energy savings.

Another advantage of an ice storage system is its ability to eliminate chiller over sizing. A “right-sized” chiller plant with ice storage operates more efficiently with smaller support equipment while lowering the connected load and reducing operating costs. Best of all, this system still provides a capacity safety factor and redundancy by building it into the ice storage capacity for practically no cost compared to oversized systems.

Trane air-cooled chillers are uniquely suited to low temperature applications like ice storage because of the ambient relief experienced at night. Chiller ice making efficiencies are typically similar to or even better than standard cooling daytime efficiencies as a result of night-time dry-bulb ambient relief.

Standard smart control strategies for ice storage systems are another advantage of the chiller. The dual mode control functionality is integrated right into the chiller. Trane Tracer® building management systems can measure demand and receive pricing signals from the utility and decide when to use the stored cooling and when to use the chiller.
Unit Placement

Setting the Unit

A base or foundation is not required if the selected unit location is level and strong enough to support the unit’s operating weights shown in Weights chapter.

For a detailed discussion of base and foundation construction, see the unit Installation, Operation or Maintenance (IOM) manual. Manuals are available through online product portal pages or from your local office.

HVAC equipment must be located to minimize sound and vibration transmission to the occupied spaces of the building structure it serves. If the equipment must be located in close proximity to a building, it should be placed next to an unoccupied space such as a storage room, mechanical room, etc. It is not recommended to locate the equipment near occupied, sound sensitive areas of the building or near windows. Locating the equipment away from structures will also prevent sound reflection, which can increase sound levels at property lines or other sensitive points.

Isolation and Sound Emission

Structurally transmitted sound can be reduced by elastomeric vibration eliminators. Elastomeric isolators are generally effective in reducing vibratory noise generated by compressors, and therefore, are recommended for sound sensitive installations. An acoustical engineer should always be consulted on critical applications.

Figure 3. Installation example

For maximum isolation effect, water lines and electrical conduit should also be isolated. Wall sleeves and rubber isolated piping hangers can be used to reduce sound transmitted through water piping. To reduce the sound transmitted through electrical conduit, use flexible electrical conduit.

Local codes on sound emissions should always be considered. Since the environment in which a sound source is located affects sound pressure, unit placement must be carefully evaluated. Sound power levels for chillers are available on request.

Servicing

Adequate clearance for evaporator, condenser and compressor servicing should be provided. Recommended minimum space envelopes for servicing are located in the dimensional data section and can serve as a guideline for providing adequate clearance. The minimum space envelopes also allow for control panel door swing and routine maintenance requirements. Local code requirements may take precedence.
Application Considerations

Unit Location

General

Unobstructed flow of condenser air is essential to maintain chiller capacity and operating efficiency. When determining unit placement, careful consideration must be given to assure a sufficient flow of air across the condenser heat transfer surface. Two detrimental conditions are possible and must be avoided: warm air recirculation and coil starvation. Air recirculation occurs when discharge air from the condenser fans is recycled back to the condenser coil inlet. Coil starvation occurs when free airflow to the condenser is restricted.

Condenser coils and fan discharge must be kept free of snow or other obstructions to permit adequate airflow for satisfactory unit operation. Debris, trash, supplies, etc., should not be allowed to accumulate in the vicinity of the air-cooled chiller. Supply air movement may draw debris into the condenser coil, blocking spaces between coil fins and causing coil starvation.

Both warm air recirculation and coil starvation cause reductions in unit efficiency and capacity due to higher head pressures. The air-cooled chiller offers an advantage over competitive equipment in these situations. Operation is minimally affected in many restricted air flow situations due to its advanced Adaptive Control™ microprocessor which has the ability to understand the operating environment of the chiller and adapt to it by first optimizing its performance and then staying on line through abnormal conditions. For example, high ambient temperatures combined with a restricted air flow situation will generally not cause the air-cooled chiller to shut down. Other chillers would typically shut down on a high pressure nuisance cut-out in these conditions.

Cross winds, those perpendicular to the condenser, tend to aid efficient operation in warmer ambient conditions. However, they tend to be detrimental to operation in lower ambient due to the accompanying loss of adequate head pressure. Special consideration should be given to low ambient units. As a result, it is advisable to protect air-cooled chillers from continuous direct winds exceeding 10 mph (4.5 m/s) in low ambient conditions.

The recommended lateral clearances are depicted in the close spacing engineering bulletin available from your local office.

Provide Sufficient Unit-to-Unit Clearance

Units should be separated from each other by sufficient distance to prevent warm air recirculation or coil starvation. Doubling the recommended single unit air-cooled chiller clearances will generally prove to be adequate.

Walled Enclosure Installations

When the unit is placed in an enclosure or small depression, the top of the surrounding walls should be no higher than the top of the fans. The chiller should be completely open above the fan deck. There should be no roof or structure covering the top of the chiller. Ducting individual fans is not recommended.
Model Number Descriptions

Unit Model Number

Digit 1, 2, 3, 4 — Unit Model
ACSA = Air-Cooled Scroll Chiller

Digit 5, 6, 7 — Nominal Tonnage
140 = 140 Tons
160 = 160 Tons
180 = 180 Tons
200 = 200 Tons
215 = 215 Tons
230 = 230 Tons

Digit 8 — Compressor Type
2 = Scroll with Variable Volume Ratio

Digit 9 — Unit Voltage
A = 200/60/3
B = 230/60/3

| Avail Head Pressure\(c\) | HP | 20.9 | 22.6 | 22.9 | 27.1 | 26.3 | 26.5 |

\(a\) Data shown for one circuit only. The second circuit always matches.

\(b\) Minimum and maximum flow rates apply to constant-flow chilled water system running at AHRI conditions, without freeze inhibitors added to the water loop.

\(c\) Pump available head pressure is based on 44/54° evaporator water, .0001 hr-ft.-°F/Btu, 95°F ambient and 0 ft. elevation.
Controls

Tracer UC800 Controller

Trane Ascend™ chillers offer predictive controls that anticipate and compensate for load changes. Other strategies made possible with the Tracer® UC800 controls are:

Feedforward Adaptive Control

Feedforward is an open-loop, predictive control strategy designed to anticipate and compensate for load changes. It uses evaporator entering-water temperature as an indication of load change. This allows the controller to respond faster and maintain stable leaving-water temperatures.

Adaptive Controls

Adaptive Controls directly sense the control variables that govern the operation of the chiller: evaporator pressure and condenser pressure. When any one of these variables approaches a limit condition when damage may occur to the unit or shutdown on a safety, Adaptive Controls takes corrective action to avoid shutdown and keep the chiller operating. This happens through combined actions of compressor and/or fan staging. Whenever possible, the chiller is allowed to continue making chilled water. This keeps cooling capacity available until the problem can be solved. Overall, the safety controls help keep the building or process running and out of trouble.

Integrated Rapid Restart

Bringing a chiller back online rapidly after a loss of power is critical to operations in mission critical environments like data centers and hospitals which demand the highest levels of reliability.

A loss of cooling capacity can be costly, which is why Trane chillers are designed and engineered for Rapid Restart™. In the event of a power interruption, the chiller will start a compressor before the front panel display is fully powered up eliminating the need for UPS. This not only helps the chiller get back online faster, but it also provides a simple and reliable solution to minimize the risks of financially devastating damage to assets caused by overheating due to a power loss.

Of course, the truest test of a chiller’s restart capabilities is the amount of time it takes to resume full-load cooling, and this is where the chiller really shines. An 80 percent cooling load can be achieved in less than 2.5 minutes after power restoration—your assurance that the cooling capacity your equipment requires is just a few minutes away.

Rapid Restart Test

After completion of a standard full load witness test, power to the chiller will be cut and then reapplied to demonstrate the chiller’s rapid restart capabilities for disaster relief.

AdaptiSpeed Control

Compressor speed is used to control capacity of the chiller, optimizing mathematically with the condenser fan speed to provide the highest level of performance. The increased performance of the controller allows the chiller to operate longer at higher efficiency, and with greater stability.

Tracer AdaptiView TD7 Operator Interface

The standard Tracer® AdaptiView™ TD7 display provided with the Tracer® UC800 controller features a 7” LCD touch-screen, allowing access to all operational inputs and outputs. This is an advanced interface that allows the user to access any important information concerning setpoints, active temperatures, modes, electrical data, pressure, and diagnostics. It uses full text display available in 26 languages.

Display Features Include:

- LCD touch-screen with LED backlighting, for scrolling access to input and output operating information
• Single-screen, folder/tab-style display of all available information on individual components (evaporator, condenser, compressor, etc.)
• Manual override indication
• Password entry/lockout system to enable or disable display
• Automatic and immediate stop capabilities for standard or immediate manual shutdown
• Fast, easy access to available chiller data in tabbed format, including:
  – Easy to view Operating Modes
  – Logical Sub-Component Reports:
    • Evaporator
    • Condenser
    • Compressor
    • Motor
  – 3 User Programmable Custom Reports
  – ASHRAE report
  – Logsheet Report
  – Alarms Report
  – 8 pre-defined Standard Graphs
  – 4 User Programmable Custom Graphs
  – Chiller Settings
  – Feature Settings
  – Chilled Water Reset
  – Manual Control Settings
  – Globalization Settings
  – Support of 26 languages
  – Brightness Setting
  – Cleaning Mode

**System Integration**

**Adaptive Control**

Adaptive Control directly senses the control variables that govern the operation of the chiller: evaporator pressure and condenser pressure. When any one of these variables approaches a limit condition at which damage may occur to the unit or it may shutdown on a safety, Adaptive Control takes corrective action to avoid shutdown and keep the chiller operating. This happens through combined actions of compressor and/or fan staging. Whenever possible, the chiller is allowed to continue making chilled or hot water. This keeps cooling capacity available until the problem can be solved. Overall, the safety controls help keep the building or process running smoothly.

**Stand-Alone Controls**

Single chillers installed in applications without a building management system are simple to install and control: only a remote auto/stop for scheduling is required for unit operation. Signals from the chilled-water pump contactor auxiliary, or a flow switch, are wired to the chilled-water flow interlock. Signals from a time clock or some other remote device are wired to the external auto/stop input.

• Auto/Stop - A job-site provided contact closure turns the unit on and off.
• Emergency Stop - A job-site provided contact opening wired to this input turns the unit off and requires a manual reset of the unit microcomputer. This closure is typically triggered by a job-site provided system such as a fire alarm.
Hardwire Points
Microcomputer controls allow simple interface with other control systems, such as time clocks, building automation systems, and ice storage systems via hardwire points. This means you have the flexibility to meet job requirements while not having to learn a complicated control system.
Remote devices are wired from the control panel to provide auxiliary control to a building automation system. Inputs and outputs can be communicated via a typical 4–20 mA electrical signal, an equivalent 2–10 Vdc signal, or by utilizing contact closures.
This setup has the same features as a stand-alone water chiller, with the possibility of having additional optional features:
- Ice making control
- External chilled water setpoint, external demand limit setpoint
- Chilled water temperature reset
- Programmable relays - available outputs are: alarm-latching, alarm-auto reset, general alarm-warning, chiller limit mode, compressor running, and Tracer control.

BACnet Interface
Tracer® AdaptiView™ control can be configured for BACnet® communications at the factory or in the field. This enables the chiller controller to communicate on a BACnet MS/TP network. Chiller setpoints, operating modes, alarms, and status can be monitored and controlled through BACnet.
Tracer AdaptiView controls conform to the BACnet B-ASC profile as defined by ASHRAE 135-2004.

LonTalk Communications Interface (LCI-C)
The optional LonTalk® Communications Interface for Chillers (LCI-C) is available factory or field installed. It is an integrated communication board that enables the chiller controller to communicate over a LonTalk network. The LCI-C is capable of controlling and monitoring chiller setpoints, operating modes, alarms, and status. The Trane LCI-C provides additional points beyond the standard LonMARK® defined chiller profile to extend interoperability and support a broader range of system applications. These added points are referred to as open extensions. The LCI-C is certified to the LonMARK Chiller Controller Functional Profile 8040 version 1.0, and follows LonTalk FTT-10A free topology communications.

Modbus Interface
Tracer® AdaptiView™ control can be configured for Modbus™ communications at the factory or in the field. This enables the chiller controller to communicate as a slave device on a Modbus network. Chiller setpoints, operating modes, alarms, and status can be monitored and controlled by a Modbus master device.

Tracer SC
The Tracer® SC system controller acts as the central coordinator for all individual equipment devices on a Tracer building automation system. The TracerSC scans all unit controllers to update information and coordinate building control, including building subsystems such as VAV and chiller water systems. With this system option, the full breadth of Trane’s HVAC and controls experience are applied to offer solutions to many facility issues. The LAN allows building operators to manage these varied components as one system from any personal computer with web access. The benefits of this system are:
- Improved usability with automatic data collection, enhanced data logging, easier to create graphics, simpler navigation, pre-programmed scheduling, reporting, and alarm logs.
- Flexible technology allows for system sizes from 30 to 120 unit controllers with any combination of LonTalk® or BACnet® unit controllers.
- LEED certification through site commissioning report, energy data collection measurement, optimizing energy performance, and maintaining indoor air quality.
Energy savings programs include: fan pressure optimization, ventilation reset, and chiller plant control (adds and subtracts chillers to meet cooling loads).

**Building Automation and Chiller Plant Control**

The UC800 controller can communicate with Trane Tracer® SC and Tracer® ES building automation systems, which include pre-engineered and flexible control for chiller plants. These building automation systems can control the operation of the complete installation: chillers, pumps, isolating valves, air handlers, and terminal units. Trane can undertake full responsibility for optimized automation and energy management for the entire chiller plant. The main functions are:

- **Chiller sequencing**: equalizes the number of running hours of the chillers. Different control strategies are available depending on the configuration of the installation.
- **Control of the auxiliaries**: includes input/output modules to control the operation of the various auxiliary equipment (water pumps, valves, etc.)
- **Time-of-day scheduling**: allows the end user to define the occupancy period, for example: time of the day, holiday periods and exception schedules.
- **Optimization of the installation start/stop time**: based on the programmed schedule of occupancy and the historical temperature records. Tracer SC calculates the optimal start/stop time of the installation to get the best compromise between energy savings and comfort of the occupants.
- **Communication capabilities**: local, through a PC workstation keyboard. Tracer® SC can be programmed to send messages to other local or remote workstations and or a pager in the following cases:
  - Analog parameter exceeding a programmed value
  - Maintenance warning
  - Component failure alarm
  - Critical alarm messages. In this latter case, the message is displayed until the operator acknowledges the receipt of the information. From the remote station it is also possible to access and modify the chiller plants control parameters.
- **Remote communication through a modem**: as an option, a modem can be connected to communicate the plant operation parameters through voice grade phone lines. A remote terminal is a PC workstation equipped with a modem and software to display the remote plant parameters.

**Integrated Comfort System (ICS)**

The onboard chiller controller is designed to be able to communicate with a wide range of building automation systems. In order to take full advantage of chiller’s capabilities, incorporate your chiller into a Tracer® SC building automation system.

But the benefits do not stop at the chiller plant. At Trane, we realize that all the energy used in your cooling system is important. That is why we worked closely with other equipment manufacturers to predict the energy required by the entire system. We used this information to create patented control logic for optimizing HVAC system efficiency.

The building owners challenge is to tie components and applications expertise into a single reliable system that provides maximum comfort, control, and efficiency. Trane® Integrated Comfort systems (ICS) are a concept that combines system components, controls, and engineering applications expertise into a single, logical, and efficient system. These advanced controls are fully commissioned and available on every piece of Trane equipment, from the largest chiller to the smallest VAV box. As a manufacturer, only Trane offers this universe of equipment, controls, and factory installation and verification.

**Note:** Field wire insulation temperature rating must be minimum 90°C unless otherwise specified.

<sup>(a)</sup> Terminal block is not available on units with optional pump package.
Electrical Connections

Figure 4. Field wiring
**Diagram: Unit Field Wiring**

**General Notes:**

1. WIRING OF UNIT FIELD CONNECTIONS SHOWN IS RECOMMENDED FIELD WIRING OF OTHER IN UNITS.

2. ALL WIRING ADAPTOR BETWEEN COMMUNICATION INTERFACE MODULE DIGITAL I/O TERMINAL BLOCKS AND SINGLE-SOURCE POWER IS PROVIDED AS STANDARD ON THIS PRODUCT. FIELD CONNECTIONS ARE MADE TO DEVICES 1Q1 OR 1X1.

3. ELECTRICAL CONNECTIONS BETWEEN DRY CONTACTS FOR THE INSTRUCTIONS OF THIS UNIT. FIELD CONNECTIONS ARE MADE TO THE UNIT. CONNECTION TO THE CONDUCTOR IS TO BE MADE USING THE INDICATED TERMINAL BLOCKS OR TERMINAL STRIPS.

4. TERMINALS 1 & 3 ARE TO BE WIRING % CAPACITY. OUTPUT CONFIGURED 2-10VDC.

5. TERMINALS 2 & 3 ARE TO BE WIRING CUSTOMER EXTERNAL CHILLED WATER SETPOINT INPUT CONFIGURED 2-10VDC FROM FACTORY. SEE OPERATING INSTRUCTION TO CONFIGURE FOR 4-20mA.

6. TERMINALS 5 & 6 ARE TO BE WIRING CUSTOMER EXTERNAL DEMAND LIMIT SETPOINT INPUT CONFIGURED 2-10VDC FROM FACTORY. SEE OPERATING INSTRUCTION TO CONFIGURE FOR 4-20mA.

7. CONTACT RATING AND REQUIREMENTS:

   - UNIT PROVIDED DRY CONTACTS FOR THE CONDENSER/CHILLED WATER PUMP CONTROL. RELAY CONTACT RATINGS AT 120VAC: 7.2A RESISTIVE, 2.88A PILOT DUTY, OR 1/3HP, 7.2 FLA. CONTACTS ARE RATED FOR 240VAC, 5A GENERAL PURPOSE DUTY.

   - CUSTOMER SUPPLIED CONTACTS FOR ALL LOW VOLTAGE CONNECTIONS MUST BE COMPATIBLE WITH DRY CIRCUIT 24VDC FOR A 12mA RESISTIVE LOAD. SILVER OR GOLD PLATED CONTACTS ARE RECOMMENDED.

8. TERMINALS 1 & 3 ARE TO BE WIRING % CAPACITY. OUTPUT CONFIGURED 2-10VDC.

9. TERMINALS 2 & 3 ARE TO BE WIRING CUSTOMER EXTERNAL CHILLED WATER SETPOINT INPUT CONFIGURED 2-10VDC FROM FACTORY. SEE OPERATING INSTRUCTION TO CONFIGURE FOR 4-20mA.

10. TERMINALS 5 & 6 ARE TO BE WIRING CUSTOMER EXTERNAL DEMAND LIMIT SETPOINT INPUT CONFIGURED 2-10VDC FROM FACTORY. SEE OPERATING INSTRUCTION TO CONFIGURE FOR 4-20mA.

11. TERMINALS 1 & 3 ARE TO BE WIRING % CAPACITY. OUTPUT CONFIGURED 2-10VDC.

12. TERMINALS 2 & 3 ARE TO BE WIRING CUSTOMER EXTERNAL CHILLED WATER SETPOINT INPUT CONFIGURED 2-10VDC FROM FACTORY. SEE OPERATING INSTRUCTION TO CONFIGURE FOR 4-20mA.

13. TERMINALS 5 & 6 ARE TO BE WIRING CUSTOMER EXTERNAL DEMAND LIMIT SETPOINT INPUT CONFIGURED 2-10VDC FROM FACTORY. SEE OPERATING INSTRUCTION TO CONFIGURE FOR 4-20mA.

14. TERMINALS 1 & 3 ARE TO BE WIRING % CAPACITY. OUTPUT CONFIGURED 2-10VDC.

15. TERMINALS 2 & 3 ARE TO BE WIRING CUSTOMER EXTERNAL CHILLED WATER SETPOINT INPUT CONFIGURED 2-10VDC FROM FACTORY. SEE OPERATING INSTRUCTION TO CONFIGURE FOR 4-20mA.

16. TERMINALS 5 & 6 ARE TO BE WIRING CUSTOMER EXTERNAL DEMAND LIMIT SETPOINT INPUT CONFIGURED 2-10VDC FROM FACTORY. SEE OPERATING INSTRUCTION TO CONFIGURE FOR 4-20mA.

17. TERMINALS 1 & 3 ARE TO BE WIRING % CAPACITY. OUTPUT CONFIGURED 2-10VDC.

18. TERMINALS 2 & 3 ARE TO BE WIRING CUSTOMER EXTERNAL CHILLED WATER SETPOINT INPUT CONFIGURED 2-10VDC FROM FACTORY. SEE OPERATING INSTRUCTION TO CONFIGURE FOR 4-20mA.

19. TERMINALS 5 & 6 ARE TO BE WIRING CUSTOMER EXTERNAL DEMAND LIMIT SETPOINT INPUT CONFIGURED 2-10VDC FROM FACTORY. SEE OPERATING INSTRUCTION TO CONFIGURE FOR 4-20mA.

Note: Weights include factory charge of refrigerant and oil.
Mechanical Specifications

General

Units are leak tested, pressure tested, then evacuated and charged. All chillers are factory tested prior to shipment. Units ship with a full operating charge of oil and refrigerant as standard. Units can also be shipped with a nitrogen charge if required. Unit panels, structural elements and control boxes are constructed of galvanized steel and mounted on a bolted galvanized steel base. Unit panels, control boxes and the structural base are finished with a baked on powder paint.

Certified AHRI Performance

Trane air-cooled chillers are rated within the scope of the Air-Conditioning, Heating & Refrigeration Institute (AHRI) Certification Program and display the AHRI Certified® mark as a visual confirmation of conformance to the certification sections of AHRI Standard 550/590 (I-P) and ANSI/AHRI Standard 551/591 (SI). The applications in this catalog specifically excluded from the AHRI certification program are:

- Custom Units
- Units produced outside of the USA for installations outside the USA
- Evaporatively-cooled chillers
- Units with evaporators that use fluid other than fresh water except units containing freeze protection fluids in the evaporator with a leaving chilled fluid temperature above 32°F [0°C] are certified when rated per the Standard with water.

Refrigeration Circuits

All chiller sizes are designed with two refrigerant circuits.

Each refrigeration circuit includes two or three scroll compressors, a compressor suction and discharge service valve, liquid line shutoff valve, removable core filter, liquid line sight glass with moisture indicator, charging port and an electronic expansion valve.

Evaporator

Braze plate heat exchanger is made of stainless steel with copper as the braze material. It is designed to withstand a refrigerant side working pressure of 460 psig and a waterside working pressure of 150 psig. Evaporator is tested at 1.1 times maximum allowable refrigerant side working pressure and 1.5 times maximum allowable water side working pressure.

Immersion heaters protect the evaporator to an ambient of -20°F (-29°C). The evaporator is covered with factory-installed 0.75 inch (19.05 mm) Armaflex II or equal (k=0.28) insulation. Foam insulation is used on the suction line.

Condenser and Fans

The air-cooled microchannel condenser coils use all aluminum brazed fin construction. The condenser coil has an integral subcooling circuit. The maximum allowable working pressure of the condenser is 650 psig. Condensers are factory proof and leak tested at 1.1 times maximum allowable refrigerant side working pressure. Coils can be cleaned with high pressure water.

Direct-drive vertical-discharge airfoil condenser fans are dynamically balanced. The condenser fan motors are permanent magnet motors with integrated drive to provide variable speed fan control for all fans.

Chillers are equipped with EC condenser fan motors with permanently lubricated ball bearings and internal thermal and overload protection.

Compressor

The unit is equipped with two or more hermetic, direct-drive, 3600 rpm 60 Hz (3000 rpm 50 Hz) suction gas-cooled scroll compressors with intermediate discharge valve to increase seasonal
efficiency. Overload protection is included. The compressor includes: centrifugal oil pump, oil level sight glass and oil charging valve. Each compressor will have compressor heaters installed and properly sized to minimize the amount of liquid refrigerant present in the oil sump during off cycles.

Unit Controls

All unit controls are housed in an outdoor rated weather tight enclosure with removable plates to allow for customer connection of power wiring and remote interlocks. All controls, including sensors, are factory mounted and tested prior to shipment.

Microcomputer controls provide all control functions including startup and shut down, leaving chilled water temperature control, evaporator flow proving, compressor staging and speed control, electronic expansion valve modulation, condenser fan sequencing and speed control, anti-recycle logic, automatic lead/lag compressor starting, and load limiting.

Tracer UC800

The Tracer® UC800 unit control module, utilizing Adaptive Control™ microprocessor, automatically takes action to avoid unit shut-down due to abnormal operating conditions associated with low refrigerant pressure, high condensing pressure, AFD/Compressor current overload, low oil return or low AFD cooling, low discharge superheat, and high compressor discharge temperature. Should the abnormal operating condition continue until a protective limit is violated, the unit will be shut down.

Unit protective functions of the UC800 include: loss of chilled water flow, evaporator freezing, loss of refrigerant, low refrigerant pressure, high refrigerant pressure, high compressor motor temperature, and loss of oil to the compressor.

Tracer AdaptiView TD7 Display

A full color Tracer AdaptiView™ TD7 touch screen display indicates all important unit and circuit parameters, in logical groupings on various screens. The parameters including chilled water set point, leaving chilled water temperature, demand limit set point, evaporator and condenser refrigerant temperatures and pressures, compressor and fan speeds, and all pertinent electrical information. The display also provides “on screen” trending graphs of predefined parameters as well as customizable trend graphs based on user defined parameters from a list of all available parameters. The display also provides indication of the chiller and circuits’ top level operating modes with detailed sub-mode reports available with a single key press, as well as diagnostics annunciation and date and time stamped diagnostic history. The color display is fully outdoor rated, and, can be viewed in full daylight without opening any control panel doors.

Standard power connections include main three phase power to the compressors, condenser fans and control power transformer and optional connections are available for the 115 volt/60 Hz single phase power for the thermostatically controlled evaporator heaters for freeze protection.

- Outdoor capable:
  - Removable Cover
  - UV Resistant Touchscreen
  - -40°C to 70°C Operating Temperature
  - IP56 rated (Power Jets of Water from all directions)
- RoHS Compliant
- UL 916 Listed
- CE Certification
- Emissions: EN55011 (Class B)
- Immunity: EN61000 (Industrial)
- Display:
  - 7 inch diagonal
  - 800x480 pixels
- TFT LCD @ 600 nits brightness
- 16 bit color graphic display

- Display Features:
  - Alarms
  - Reports
  - Chiller Settings
  - Display Settings

- Graphing
- Global Application with Support for 26 Languages

**Chilled Water Reset**

Control logic and factory installed sensors are provided to reset leaving chilled water temperature. The set point can be reset based on ambient temperature or return evaporator water temperature.

**Factory Mounted Flow Proving and Flow Control**

The factory installed evaporator water flow switch is provided with the control logic and relays to turn the chilled water flow on and off as the chiller requires for operation and protection. This function is a requirement on the chiller.
Options

Application Options

Ice Making

The ice making option provides special control logic to handle low temperature brine applications (less than 40°F [4.4°C] leaving evaporator temperature) for thermal storage applications.

Low Temperature Fluid

Low temperature option provides special control logic to handle low temperature brine applications including part load conditions below 40°F (4.4°C) leaving evaporator temperature.

Low Ambient Option

The low ambient options adds hardware and unit controls to allow start and operation down to ambient temperatures of -20°F (-29°C).

High Ambient Option

High ambient option consists of special control logic, compressor motors, and variable speed drives to permit high ambient (up to 130°F [54°C]) operation. Low side ambient remains 32°F (0°C).

Wide Ambient Option

The wide ambient option combines the features of low and high ambient options for an ambient range of -20 to 130°F (-29 to 54.4°C).

Dual High Head Pump Package

Pump package includes: two high head pumps, two VFDs, drainage valves, shut-off valves at entering and leaving connections. The pump package is single point power integrated into the chiller unit power with a separate factory wired control panel. The control of the pump is integrated into the chiller controller. The controller displays both of the evaporator pump starts and run-times. Freeze protection down to an ambient of -4°F (-20°C) is included as standard. The cold parts of the pump package will also be insulated. Designed with one redundant pump and VFD, the chiller controls both pumps through a lead/lag and failure/recovery functionality.

Two variable speed drives are installed to control the pump. The inverter is adjusted upon start up to balance the system flow and head requirements.

Chiller will require a field-supplied expansion tank when optional pump package is provided. Expansion tank should be field installed before pump inlet at water piping system outside of pump package, the expansion volume is depended on fluid type, temperature range, pressure and loop volume.

Single High Head Pump Package

Pump package includes: one high head pump, VFD, drainage valves, shut-off valves at entering and leaving connections. The pump package is single point power integrated into the chiller unit power with a separate factory wired control panel. The control of the pump is integrated into the chiller controller. The controller displays evaporator pump starts and run-times. Freeze protection down to an ambient of -4°F (-20°C) is included as standard. The cold parts of the pump package will also be insulated.

A variable speed drive is installed to control the pump. The inverter is adjusted upon start up to balance the system flow and head requirements.

Chiller will require a field-supplied expansion tank when optional pump package is provided. Expansion tank should be field installed before pump inlet at water piping system outside of pump package, the expansion volume is depended on fluid type, temperature range, pressure and loop volume.
Electrical Options

Circuit Breaker
A HACR rated molded case capacity circuit breaker (UL approved) is available. Circuit breaker can also be used to disconnect chiller from main power with a through-the-door handle.

Control Options

BACnet Communications Interface
Allows the user to easily interface with BACnet® via a single twisted pair wiring to a factory installed and tested communication board.

LonTalk (LCI-C) Communications Interface
Provides the LONMARK® chiller profile inputs/outputs for use with a generic building automation system via a single twisted pair wiring to a factory installed and tested communication board.

ModBus Communications Interface
Allows the user to easily interface with ModBus™ via a single twisted pair wiring to a factory installed and tested communication board.

Remote Input Options
Option permits remote chilled liquid setpoint, remote demand limit setpoint, or both by accepting a 4-20 mA or 2-10 Vdc analog signal.

Remote Output Options
Permits alarm relay outputs, chiller Percent Capacity via a 2–10VDC signal, or both.

Tracer Communication Interface
Interface permits bi-directional communication to Tracer® SC or ES system via BACnet® interface.

Sound Options

Acoustic Package
Each compressor includes a factory installed acoustical treatment.

Options

Architectural Louvered Panels
Louvered panels cover the complete condensing coil and service area beneath the condenser.

Condenser Corrosion Protection
CompleteCoat™ is available on all size units for corrosion protection. Job site conditions should be considered to determine the need to order coating to inhibit coil corrosion and ensure extended equipment life. CompleteCoat™ option provides fully assembled coils with a flexible dip and bake epoxy coating.

Convenience Outlet
Provides a 15 amp, 115V (60 Hz) convenience outlet on the unit.

Insulation for High Humidity
The evaporator is covered with factory-installed 1.25 inch (31.8 mm) Armaflex II or equal (k=0.28) insulation.
Options

Isolators — Elastomeric

Elastomeric Isolators provide isolation between chiller and structure to help eliminate vibration transmission.
The AHRI Certified mark indicates Trane U.S. Inc. participation in the AHRI Certification program. For verification of individual certified products, go to ahridirectory.org.

Trane - by Trane Technologies (NYSE: TT), a global innovator - creates comfortable, energy efficient indoor environments for commercial and residential applications. For more information, please visit trane.com or tranetechnologies.com.

Trane has a policy of continuous product and product data improvements and reserves the right to change design and specifications without notice. We are committed to using environmentally conscious print practices.
