SAFETY SECTION

Safety signal words are used to designate a degree or level of seriousness associated with a particular hazard. The signal words for safety markings are WARNING and CAUTION.

a. WARNING indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

b. CAUTION indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It is also used to alert against unsafe practices and hazards involving only property damage.

The following safety practices and precautions must be followed during the installation, servicing, and operation of this furnace.

1. Use only with the type of gas approved for this furnace. Refer to the furnace rating plate.

2. Install this furnace only in a location and position as specified in “Location and Clearances” (page 4), of these instructions.

3. Provide adequate combustion and ventilation air to the furnace space as specified in “Air for Combustion and Ventilation” (pages 8-9), of these instructions.

4. Combustion products must be discharged outdoors. Connect this furnace to an approved vent system only, as specified in the “Venting” section (starting on page 15), of these instructions.

5. Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections, as specified in “Gas Piping” (pages 31-32), of these instructions.

6. Always install the furnace to operate within the furnace’s intended temperature-rise range with a duct system which has an external static pressure within the allowable range, as specified on the unit rating plate. Airflow with temperature rise for cfm versus static is shown in the Service Facts accompanying this furnace.

7. When a furnace is installed so that supply ducts carry air circulated by the furnace to areas outside the space containing the furnace, the return air shall also be handled by a duct(s) sealed to the furnace casing and terminating outside the space containing the furnace.

8. A gas-fired furnace for installation in a residential garage must be installed as specified in “Location and Clearances” section (page 4), of these instructions.

9. The furnace may be used for temporary heating of buildings or structures under construction only when the following conditions have been met:
   a. The furnace venting system must be complete and installed per manufacturers instructions.
   b. The furnace is controlled only by a room thermostat (no field jumpers).
   c. The furnace return air duct must be complete and sealed to the furnace and clean air filters are in place.
   d. The furnace input rate and temperature rise must be verified to be within nameplate marking.
   e. 100% of the furnace combustion air requirement must come from outside the structure.

![WARNING]

CARBON MONOXIDE POISONING HAZARD

Failure to follow the steps outlined below for each appliance connected to the venting system being placed into operation could result in carbon monoxide poisoning or death.

The following steps shall be followed for each appliance connected to the venting system being placed into operation, while all other appliances connected to the venting system are not in operation:

1. Seal any unused openings in the venting system.

2. Inspect the venting system for proper size and horizontal pitch, as required in the National Fuel Gas Code, ANSI Z223.1/NFPA 54 or the CAN/CGA B149 Installation Codes and these instructions. Determine that there is no blockage or restriction, leakage, corrosion and other deficiencies which could cause an unsafe condition.

3. As far as practical, close all building doors and windows and all doors between the space in which the appliance(s) connected to the venting system are located and other deficiencies which could cause an unsafe condition.

5. Turn on clothes dryers and any appliance not connected to the venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they are operating at maximum speed. Do not operate a summer exhaust fan.

6. Follow the lighting instructions. Place the appliance being inspected into operation. Adjust the thermostat so appliance is operating continuously.

7. If improper venting is observed during any of the above tests, the venting system must be corrected in accordance with the National Fuel Gas Code, ANSI Z221.1/NFPA 54 and/or CAN/CGA B149.1 Installation Codes.

8. After it has been determined that each appliance connected to the venting system properly vents where tested as outlined above, return doors, windows, exhaust fans, fireplace dampers and any other gas-fired burning appliance to their previous conditions of use.
f. The furnace return air temperature range is between 55 and 80 degrees Fahrenheit.
g. Clean the furnace, duct work, and components upon substantial completion of the construction process, and verify furnace operating conditions including ignition, input rate, temperature rise and venting, according to the manufacturer’s instructions.

10. This product must be gas piped by a Licensed Plumber or Gas Fitter in the Commonwealth of Massachusetts.

## GENERAL INSTALLATION INSTRUCTIONS

**NOTE:** Air leakage less than 2% of design airflow rate in accordance with ASHRAE 193.

The manufacturer assumes no responsibility for equipment installed in violation of any code or regulation. It is recommended that Manual J of the Air Conditioning Contractors Association (ACCA) or A.R.I. 230 be followed in estimating heating requirements. When estimating heating requirements for installation at altitudes above 2000 ft., remember the gas input may need to be reduced (See High Altitude Installation).

Material in this shipment has been inspected at the factory and released to the transportation agency without known damage. Inspect exterior of carton for evidence of rough handling in shipment. Unpack carefully after moving equipment to approximate location. If damage to contents is found, report the damage immediately to the delivering agency.

Codes and local utility requirements governing the installation of gas fired equipment, wiring, plumbing, and flue connections must be adhered to. In the absence of local codes, the installation must conform with latest edition of the National Fuel Gas Code ANSI Z223.1 • National Installation Code, CAN/CGA B149.1. The latest code may be obtained from the American Gas Association Laboratories, 400 N. Capitol St. NW, Washington D.C. 20001. 1-800-699-9277 or www.aga.org

These furnaces have been classified as CATEGORY IV furnaces in accordance with latest edition of ANSI Z21.47 • CAN/ CGA 2.3 standards.

Category IV furnaces operate with positive vent static pressure and with a flue loss less than 17 percent. These conditions require special venting systems, which must be gas tight and water tight. These Category IV Direct Vent furnaces are approved for installation in Manufactured/ Mobile housing when used with BAYMFGH100A.
**CAUTION**

Do NOT install the furnace in a corrosive or contaminated atmosphere.

**LOCATION AND CLEARANCES**
The location of the furnace is normally selected by the architect, the builder, or the installer. However, before the furnace is moved into place, be sure to consider the following requirements:

1. Is the location selected as near the vent and as centralized for heat distribution as practical?
2. Do all clearances between the furnace and enclosure equal or exceed the minimums shown in the Table 1.
3. Is there sufficient space for servicing the furnace and other equipment? A minimum of 24 inches front accessibility to the furnace must be provided. Any access door or panel must permit removal of the largest component.
4. Are there at least 3 inches of clearance between the furnace front panel and any closed panel or door provided?
5. Are the ventilation and combustion air openings large enough and will they remain unobstructed? If outside air is used, are the openings set 12" minimum above the highest snow accumulation level?
6. Allow sufficient height in supply plenum above or below the furnace to provide for cooling coil installation if the cooling coil is not installed at the time of this furnace installation.
7. A furnace shall be installed so electrical components are protected from water.
8. If the furnace is installed in a residential garage, it must be installed so that the burners and the ignition source are located not less than 18 inches (46 cm) above the floor and the furnace must be located or protected to avoid physical damage from vehicles.

**IMPORTANT:**
The furnace must be installed level. The only allowable variation would be slightly to the left and/or forward in upflow installations or slightly toward the front in horizontal installations. This is necessary for proper condensate drainage.

**NOTE:** On upflow 5 or 6 ton airflow models where the airflow requirement exceeds 1800 CFM - Models will require return air openings and filters on: (1) both sides; or (2) one side and the bottom; or (3) just the bottom.

---

**WARNING**

EXPLOSION HAZARD!
PROpane gas is heavier than air and may collect in any low areas or confined spaces. In addition, odorant fade may make the gas undetectable except with a warning device. If the gas furnace is installed in a basement, an excavated area or a confined space, it is strongly recommended to contact a gas supplier to install a gas detecting warning device in case of a gas leak.

**NOTE:** The manufacturer of your furnace does NOT test any detectors and makes no representations regarding any brand or type of detector.

---

**UPFLOW INSTALLATION**
Standoffs and screws (See Figure 1) are included with the cased coils for attachment to the furnace.

**NOTE:** The top flanges on the furnace must be bent 90 degrees upward to allow the coil attachment.

There are clearance alignment holes near the bottom of the coil wrapper. Drill screws are used to engage the furnace top flanges. The standoff is inserted into the cabinet alignment hole. The drill screws are inserted through the standoffs then screwed into the furnace flange.

The coil is always placed downstream of the furnace airflow.

---

**DOWNFLOW INSTALLATIONS**

**WARNING**

FIRE HAZARD
Do NOT install the furnace directly on carpeting, tile or other combustible material other than wood flooring. For vertical downflow application, subbase (BAY-BASE-205) must be used between the furnace and combustible flooring. When the downflow furnace is installed vertically with a cased coil, a subbase is not required.

**Required floor opening:**

---

<table>

HORIZONTAL INSTALLATION

The coil and furnace must be fully supported when used in the horizontal position. It is always recommended that an auxiliary drain pan be installed under a horizontally installed evaporator coil or 95% gas furnace. Connect the auxiliary drain line to a separate drain line (no trap is needed in this line).

Three brackets (with screws) are included with downflow furnaces for installation to stabilize and secure the furnace and cased coil in the horizontal position. See Figure 4.

IMPORTANT:
The cased coil must be placed downstream of the furnace. In horizontal installations, the apex of the coil may point either toward or away from the furnace. See the coil Installer’s Guide for more details.

The cased coil is secured to the furnace and both the furnace and the cased coil must be properly supported. The brackets mount using the rear screws on the coil case and use the screws provided to secure the bracket to the furnace. Use four of the screws provided to secure the bracket. The upflow furnace, converted to horizontal, aligns and attaches the coil as in Figure 1. However, the coil requires additional support.

The furnace may be placed horizontally in a crawl space on a pad or other noncombustible material which will raise the unit for sufficient protection from moisture. The furnace must be supported at both ends and the middle when installed horizontally.

The furnace must also be elevated a minimum of 6 inches to allow clearance for the condensate drain to exit the cabinet in the horizontal position.

The horizontal furnace may also be suspended from the joists using 3/8” all-thread rods with pieces of angle iron underneath the furnace to form a hanging rack at both ends and the midpoint. The rods need to be of sufficient length to allow for proper clearances from combustible materials. The angle iron needs to be at least 32” in length to allow for access to service panels.

AIR FOR COMBUSTION AND VENTILATION

If these furnaces are installed in a nondirect vent capacity then the adequate flow of combustion and ventilating air must not be obstructed from reaching the furnace. Air openings provided for combustion air must be kept free of obstructions which restrict the flow of air. Airflow restrictions affect the efficiency and safe operation of the furnace. Keep this in mind should you choose to remodel or change the area which contains your furnace. Furnaces must have a free flow of air for proper performance.

Provisions for combustion and ventilation air shall be made in accordance with latest edition of Section 5.3, Air for Combustion and Ventilation, of the National Fuel Gas Code, ANSI Z223.1 — CAN/CGA B149.1 or applicable provisions of the local building codes. Special conditions created by mechanical exhausting of air and fireplaces must be considered to avoid unsatisfactory furnace operation.
OUTSIDE AIR IS RECOMMENDED

The use of indoor air for most applications is acceptable, unless there is the presence of corrosive chemicals or contamination. Certain types of installation will require the use of outside air for combustion.

The following types of installations will require use of OUTDOOR AIR for combustion, due to chemical exposures:

* Commercial buildings
* Buildings with indoor pools
* Furnaces installed in "confined" laundry rooms
* Furnaces installed in "confined" hobby or craft rooms
* Furnaces installed near chemical storage areas.

Exposure to the following substances in the combustion air supply will also require OUTDOOR AIR for combustion:

* Permanent wave solutions
* Chlorinated waxes and cleaners
* Chlorine based swimming pool chemicals
* Water softening chemicals
* Deicing salts or chemicals
* Carbon Tetrachloride
* Halogen type refrigerants
* Cleaning solvents (such as perchloroethylene)
* Printing inks, paint removers, varnish, etc.
* Hydrochloric acid
* Cements and glues
* Antistatic fabric softeners for clothes dryers
* Masonry acid washing materials

Furnace locations may be in a "confined space" or an "unconfined space".

Unconfined space is defined in Figure 6. These spaces may have adequate air by infiltration to provide air for combustion and ventilation. Buildings with tight construction (for example, weather stripping, heavily insulated, caulked, vapor barrier, etc.), may need additional air to be provided as described for confined space.

Confined spaces are installations with less than 50 cu. ft. of space per 1000 BTU/hr input from all equipment installed, as in Figure 7. Air for combustion and ventilation requirements can be supplied from inside the building as in Figure 8 or from the outdoors, as in Figure 9.

DUCT CONNECTIONS

Air duct systems should be installed in accordance with standards for air conditioning systems, National Fire Protection Association Pamphlet No. 90. They should be sized in accordance with ACCA Manual D or whichever is applicable.

Central furnaces, when used in connection with cooling units, shall be installed in parallel or on the upstream side of the cooling coil to avoid condensation in the heat exchanger. With a parallel flow arrangement, the dampers or other means used to control flow of air shall be adequate to prevent chilled air from entering the furnace, and if manually operated, must be equipped with means to prevent operation of either unit unless the damper is in full heat or cool position.

On any job, flexible connections of nonflammable material may be used for return air and discharge connections to prevent transmission of vibration. Though these units have been specifically designed for quiet, vibration free operation, air ducts can act as sounding boards and, if poorly installed, amplify the slightest vibration to the annoyance level.

When the furnace is located in a utility room adjacent to the living area, the system should be carefully designed with returns to minimize noise transmission through the return air grille. Although these furnaces are designed with large blowers operating at moderate speeds, any blower moving a high volume of air will produce audible noise which could be objectionable when the unit is located very close to a living area. It is often advisable to route the return air ducts under the floor or through the attic. Such design permits the installation of air return remote from the living area (i.e. central hall).

When the furnace is installed so that the supply ducts carry air circulated by the furnace to areas outside the space containing the furnace, the return air shall also be handled by a duct(s) sealed to the furnace and terminating outside the space containing the furnace.

RETURN AIR DUCT CONNECTION

NOTE:
On upflow 5 or 6 ton airflow models where the airflow requirement exceeds 1800 CFM - Models will require return air openings and filters on: (1) both sides; or (2) one side and the bottom; or (3) just the bottom.

NOTE: The top flanges on the furnace must be bent 90 degrees upward to allow connection to the ducting.

All return air duct systems should provide for installation of return air filters.

1. Determine the appropriate position to set the furnace in order to connect to the existing supply and return ductwork.

2. For side return installations on upflow models, remove the insulation around the opening in the blower compartment.

NOTE: Minimum return air temperature is 55° F.

3. The side panels on upflow furnaces include locating notches which may be used as guides for cutting an opening for return air. Refer to Figure 11 and the outline drawing on pages 5-6 for duct connection dimensions for various furnaces.

4. If a 3/4” flange is to be used for attaching the air inlet duct, add to cut where indicated by dashed lines in Figure 11. Cut corners diagonally and bend outward to form flange.

5. If flanges are not required, and a filter frame is installed, cut along knockout guidelines.

6. Upflow Furnaces: Use the optional filter rack on either side or on the bottom if the filter is to be used within the furnace cabinet.

When the upflow furnace is installed in the horizontal application and a return duct is attached to the top side as shown in Figure 10, install the filter in a remote location.

Do not install the filter in the return duct directly above the furnace in horizontal applications.
When the upflow furnace is installed in the horizontal application and a close coupled (less than 36") return duct is attached to the bottom side of the furnace as shown in Figure 10, securely attach a 1/2" mesh metal hardware cloth protective screen to the inside bottom of the filter grill to prevent personal injury from contacting moving parts when reaching into the return opening to replace the filter.

Close coupled (less than 36") return (filter directly beneath bottom side return) is not recommended due to noise considerations. **Downflow Furnaces**: Brackets are factory supplied to mount filters in the return air duct work.

---

### WARNING

**FIRE OR EXPLOSION HAZARD**

Do not install the filter in the return duct directly above the furnace in horizontal applications. Install the filter remotely. Failure to follow the safety warnings exactly could result in serious injury, death or property damage.

---

### WARNING

**SAFETY HAZARD**

To prevent injury or death due to contact with moving parts, turn the power to the furnace off before servicing filters.

Failure to follow the safety warnings exactly could result in serious injury, death or property damage.

---

**RETURN AIR FILTERS**

(Filter and filter rack are not supplied with unit)

**TYPICAL UPFLOW RETURN AIR FILTER INSTALLATIONS**

These furnaces require high velocity type air filters. The optional filters may be located within the furnace blower compartment for UPFLOW furnaces in either a BOTTOM or SIDE (left side or right side) return air inlet. Some optional filters may need to be trimmed for side or bottom filter use.

The furnace and the blower filter rack installation can be seen in Figure 12.

The optional furnace filter in the bottom or side configuration can be removed by simply turning the two latches on the blower door and tilting the door forward.

The filter rails are spring loaded for automatic adjustment to allow standard size, locally obtainable replacement filters. The filter rack itself slides to adjust to the required width needed for bottom or side return.

**NOTE**: CLEARANCE REQUIRED AT TOP OF PLENUM IS 1"
NOTE: The narrow 14.5" width furnace cabinet prevents use of the filter rack for right side return. Pre-drill clearance holes and then attach filter clips with the screws provided. The filter clip with the leaf spring mounts in the rear of the cabinet.

OPTIONAL FILTER RACK INSTALLATION FOR BOTTOM RETURN - BAYRACK960

The following checklist should be used when installing as a bottom return filter on an upflow furnace:

a. Remove the filter.
b. Remove the bottom panel.
c. Pre-drill two engagement holes with 3/16” drill at dimple locations. See Figure 14.
d. With the filter removed, the filter rack is compressed and then inserted into the bottom of the furnace. The retaining screw/pin on each side inserts into engagement holes at the bottom of the furnace cabinet side. See Figure 15.
e. Reinstall the furnace filter in the bottom position by inserting the chamfer end first into the filter rack.

NOTE: Remove the bottom front channel to install the filter rack in the 14-1/2” width cabinet furnaces.

**NOTE: For upflow 5 ton airflow models where the airflow requirement exceeds 1800 CFM - Models will require return air openings and filters on: (1) both sides, or (2) one side and the bottom, or (3) just on the bottom**

## BOTTOM FILTER RACK INSTALLATION

**NOTE: For upflow 5 ton airflow models where the airflow requirement exceeds 1800 CFM - Models will require return air openings and filters on: (1) both sides, or (2) one side and the bottom, or (3) just on the bottom.**

**NOTE: Remove the bottom front channel to install the filter rack in the 14-1/2” width cabinet furnaces.**
OPTIONAL FILTER RACK INSTALLATION FOR SIDE RETURN AIR ON UPFLOW FURNACES (Left or Right) - BAYRACK960

NOTE: Upflow models only - Installation of the alternate bottom filter kit requires the bottom flange to be bent flat.

The following checklist should be used when installing a right or left side return filter on an upflow furnace:

a. Remove the filter.

b. Leave the bottom panel in place.

c. Make side cutout by following the directions in the “Return Air Duct Connections” section on page 9.

d. Compress the filter rack and reinstall in the side position on the furnace. Confirm that the upper retaining pin/screw locks into the engagement hole in the blower deck and the lower pin/screw rests against the side of the bottom panel. See Figures 14, 18-20.

e. Reinstall the furnace filter in the side position by inserting the chamfer end first into the filter rack.

X - All Models
RETURN AIR FILTERS FOR UPFLOW FURNACE
IN HORIZONTAL CONFIGURATION

NOTE: Upflow models only - Installation of the alternate bottom filter kit requires the bottom flange to be bent flat.

When the Upflow Furnace is installed in a horizontal configuration, the filter must never be installed inside or outside the cabinet directly above the blower assembly. See Figure 10 (page 10). Remote filter grilles may be used for homeowner convenience or the filters may be installed in the duct work upstream of the furnace. See Figures 20 (page 13).

Optional horizontal filter conversion kits are BAYFLTR203 for 17 1/2” width cabinets, BAYFLTR204 for 21” width cabinets, and BAYFLTR205 for 24” width cabinets. These include filters and brackets necessary for horizontal filters. See Figure 20.

ALTERNATE UPFLOW
FILTER CLIP / BRACKET INSTALLATION - KIT09224
1. Determine the location to be used. The furnace cabinet has dimples for location of the alternate furnace clips (Side return only). Pre-drill clearance holes with a 3/16” drill. Bottom return holes are pre-drilled.
2. Install the clips in front and rear of the desired location using the screws provided. The filter clip with the leaf spring mounts in the rear of the cabinet. See Figure21.

INSTALLING THE OPTIONAL FILTER
The filter may need to be cut to fit the unit depending on the location of the return air filter.

A score line and the words “CUT HERE” are located on the end of the filter. If your application requires cutting the filter, do so as indicted by the score mark.

Optional accessory door kit BAYFLTR206 is also available with narrow door to avoid flue piping in downflow furnaces.
Installer’s Guide

**GENERAL VENTING**

**WARNING**

CARBON MONOXIDE POISONING HAZARD

FURNACE MUST BE VENTED PROPERLY. FAILURE TO FOLLOW THE INSTALLATION INSTRUCTIONS FOR THE VENTING SYSTEM COULD RESULT IN CARBON MONOXIDE POISONING, FIRE OR SMOKE THAT CAN CAUSE SERIOUS BODILY INJURY, DEATH OR PROPERTY DAMAGE.

IMPORTANT:
The building owner/maintenance provider must keep the area around the vent clear from snow.

THIS FURNACE MUST BE VENTED TO THE OUTDOORS. THESE FURNACES ARE INDUCED DRAFT VENTED AND MUST NOT BE CONNECTED TO ANY VENT SERVING ANOTHER APPLIANCE. PLEASE NOTE THAT THESE FURNACES USE POSITIVE-PRESSURE VENT SYSTEMS.

Proper venting is essential to obtain maximum efficiency from a condensing furnace. Proper installation of the vent system is necessary to assure drainage of the condensate and prevent deterioration of the vent system.

American Gas Association has certified the design of condensing furnaces for a minimum of 0" clearance from combustible materials with a single wall plastic vent pipe. The recommended system is assembled from 2", 2-1/2", or 3" plastic pipe and fittings (See Table 10, page 16). Where the system is routed to the outdoors through an existing masonry chimney containing flue products from another gas appliance, or where required by local codes, then 3" venting of Type 29-4C stainless steel must be used in place of PVC material.

These furnaces have been classified as CATEGORY IV furnaces in accordance with the latest edition of ANSI Z21.47 • CAN/...
CGA-2.3 Standards. Category IV furnaces operate with positive vent pressure and with a vent gas temperature less than 140°F above the dewpoint. These conditions require special venting systems, which must be gas tight and water tight.

NOTE:
When an existing furnace is removed from a venting system serving other gas appliances, the venting system is likely to be too large to properly vent the remaining attached appliances.

IMPORTANT
These Furnaces may be installed as Direct Vent (sealed combustion) or as Nondirect Vent (single pipe). The furnaces are shipped DIRECT VENT with sealed combustion.

The following are general steps to be used to correct or resize a remaining vent system when a furnace which may not be common vented is removed from the system:

a. Determine the Btu per hour input of all remaining appliances attached to the venting system.

b. Determine the diameter, rise, and lateral of the existing venting system, as well as quantity and type of bends.

c. Use the appropriate tables in the latest edition of the National Fuel Gas Code (ANSI Z223.1 • CAN/GAS B149.1 Installation Codes or “Exhibit J” of ANSI Z223.47 • CAN/GAS-2.3 Standards. “Exhibit J” includes examples and drawings of venting systems.

IMPORTANT:
These furnaces may be installed as Direct Vent (sealed combustion) or as Nondirect vent (single pipe). The furnaces are shipped DIRECT VENT with sealed combustion.

For DIRECT VENT APPLICATION: The furnaces must be vented to the exterior of the house and combustion air MUST come through the inlet air pipe FROM OUTSIDE AIR.

For NONDIRECT VENT APPLICATION: The furnace shall be vented to the exterior of the house, but combustion air may enter from the surrounding area as long as combustion air requirements are met. (See AIR FOR COMBUSTION AND VENTILATION)

For DIRECT VENT APPLICATION: The Furnaces must be vented to the exterior of the house and combustion air MUST come through the inlet air pipe FROM OUTSIDE AIR.

NOTE: BAYVENT200* accessories can be used for inlet and outlet terminals when the pipes do not exit the structure together.

For Canadian applications, venting systems must meet ULC-S636 requirements.

For NONDIRECT VENT APPLICATION: The Furnace shall be vented to the exterior of the house, but combustion air may enter from the surrounding area as long as combustion air requirements are met. (See AIR FOR COMBUSTION AND VENTILATION)

FURNACE VENT / INLET PIPE INSTALLATION
There are many different variations of the vent / inlet air pipe combination. The vent / inlet air combination used for installation of these Furnaces depends on the needs of the location. However, these guidelines must be followed:

1. The Furnace must vent outside the structure.
2. Furnace combustion air requirements must be met for non-direct, single pipe applications.
3. For direct vent application of these Furnaces, the vent pipe and air inlet pipe do not have to exit in the same air space. However, the longest individual pipe will decide the value for the longest allowable equivalent vent / inlet air length as shown in the vent length tables on page 17 and 18.

NOTE: For single pressure zone applications, see Figure 27.

The following are EXAMPLES ONLY:

EX. 1 —
Example 1 shows the vent pipe exhausting through the roof and the inlet air coming from the interior of the house. The inlet air coming from the interior of the house must meet combustion requirements for area, etc., as shown in the section AIR FOR COMBUSTION AND VENTILATION in this Installer's Guide.

EX. 2 —
The inlet air does not have to come from outside the structure. Example 2 shows the inlet air, may come from the attic if the requirements for combustion air are met as shown in the section AIR FOR COMBUSTION AND VENTILATION.

NOTE: If only the flue gas pipe is to the outside of the structure, a straight section of pipe (long enough to exit the Furnace cabinet) must be attached to the inlet air side with an elbow (which is 5 to 10 equiv. ft.) installed on the end to prevent dust and debris from falling directly into the Furnace.
Installer’s Guide

PVC VENT FITTING MATERIAL
These fittings are available from your Gas Furnace Distributors.
Straight Pipe Sections, Couplings, 45° Elbows, 60° Elbows, 90° Elbows, Vent or Sanitary Tee, or other necessary fittings may be 2", 2½", 3", or 4" diameter. The allowable materials are shown in Table 10.

VENT FITTING MATERIAL – PLASTIC
Gas and liquid tight single wall vent fittings, designed for resistance to corrosive flue condensate, MUST be used throughout. Listed in Table 10 are designations for different types of 2" and 3" size pipe and fittings that meet these requirements. The materials listed are various grades of PVC, CPVC, ABS, and DuraVent PolyPro®.

ATTACHING VENT PIPING
Important: Products installed in Canada must use vent systems that are certified to the Standard for Type BH Gas Venting Systems (ULC S636) for Class II-A venting systems (up to 65°C). Components of the vent system must not be interchanged with other vent systems or unlisted pipe or fittings. Plastic components, specified primers, and glues must be from a single system manufacturer and not intermixed with other system manufacturer's vent system parts. In addition, the first three feet of the vent pipe must be visible for inspection.

PIPE JOINTS: All joints must be fastened and sealed to prevent escape of combustion products into the building.

MANUFACTURED MODULAR VENTING SYSTEMS

WARNING
CARBON MONOXIDE POISONING HAZARD
See Table 10 for manufactured modular venting systems that are approved for use with this product. Follow the manufacturer’s installation instructions when installing the venting system. Failure to follow this warning may result in property damage, severe personal injury, or death.

3 Allowable temperatures based on classifications covered in ASTM D3965 [Deflection Temps Under Load (264 PSI)]
4 This furnace family is approved for venting with DuraVent PolyPro® venting systems.
5 Canadian venting systems must be composed of materials that meet ULC-S636.
Connection of the pipe and collar of the **combustion air inlet** should just be a friction fit. It is recommended that the inlet air joint be sealed with RTV type sealant to allow the joint to be separated for possible future service. The inlet and vent pipes must be properly supported throughout the entire length.

Connection of the **vent pipe** to the vent collar should also be accomplished using RTV type sealant. This type sealant provides a connection which remains flexible and can be separated in the future if service needs require the removal of the vent pipe for service or clearance. See Figure 24.

**NOTE:**
To ensure proper operation at the vent lengths indicated, the combustion air inlet and vent terminals should be in the same pressure zone. Terminating the vent and inlet in different pressure zones will change the maximum vent lengths and may cause nuisance tripping of the pressure switch(es). The amount of change cannot be predicted. The selection of the inlet and outlet terminal locations are the responsibility of the designer/installer. If the installer chooses separate pressure zones for the terminals, the combustion air inlet termination must be in the higher (more positive) pressure zone.

**NOTES:**

1. For Duravent manufactured modular venting systems that are approved in Table 10, equivalent vent lengths may be different from what is shown above. Refer to the venting system manufacturer’s installation instructions for appropriate venting diameters and equivalent lengths.
2. Minimum vent length for all models: 3' horizontal or 3' vertical.
3. Do not mix pipe diameters in the same length of pipe outside the furnace cabinet (except adapters at the top of the furnace). If different inlet and vent pipe sizes are used, the vent pipe must adhere to the maximum length limit shown in the table above (See note 6 below for exception). The inlet pipe can be of a larger diameter, but never smaller than the vent pipe.
4. **Maximum pipe lengths must not be exceeded!** The length shown is not a combined total. It is the maximum length of each vent or inlet air pipe.
5. One short radius 90° elbow is equivalent to 10° of 4” pipe, 10° of 3” pipe, or 8° of 2” pipe. One long radius elbow is equivalent to 6° of 4” pipe, 7° of 3” pipe, 6° of 2.5” pipe, or 5° of 2” pipe. Two 45° elbows equal one 90° long elbow.
6. The termination tee or bend must be included in the total number of elbows. If the BAYAIR30VENTA termination kit is used, the equivalent length of pipe is 5 feet. BAYVENT200B equivalent length is 0 feet.
7. Pipe adapters are field supplied (except for the *UH1D120 models).
8. For Canadian applications, venting systems must meet ULC-S636 requirements.

**WARNING**

**Carbon Monoxide Poisoning Hazard**

Failure to follow the Duravent installation instructions if the polypropylene venting system is being placed into operation could result in carbon monoxide poisoning or death.

**NOTE:**
Follow venting instructions carefully when using PVC cement.

**IMPORTANT:**
All joints must be water tight. Flue condensate is somewhat acidic, and leaks can cause equipment damage.

2. In accordance with the current ANSI Z223.1/NFPA 54 National Fuel Gas Code.
   †. A vent shall not terminate directly above a sidewalk or paved driveway that is located between two single family dwelling and serves both dwellings.
   ‡. Permitted only if veranda, porch, deck, or balcony is fully open on a minimum of two sides beneath the floor.
   * Clearance in accordance with local installation codes and the requirements of the gas supplier and the manufacturer's Installation Instructions.
WARNING
CARBON MONOXIDE POISONING HAZARD
Do not replace any of the factory supplied venting components with field fabricated parts. Failure to follow this safety warning exactly could result in damaged vents, damaged components, carbon monoxide poisoning, or death.

HORIZONTAL VENTING

NOTE:
Vent termination kit BAYAIR30AVENTA or BAYVENT200B may be used instead of the horizontal and vertical termination options shown in the following figures. For Canadian applications, venting systems must meet ULC-S636 requirements.

CAUTION
When the vent pipe is exposed to temperatures below freezing, i.e., when it passes through unheated spaces, etc., the pipe must be insulated with 1/2 inch (22.7 mm) thick Armalflex-type insulation or equal. If the space is heated sufficiently to prevent freezing, then the insulation would not be required. If domestic water pipes are not protected from freezing then it is assumed the space meets the condition of a heated space.

POSSIBLE CONFIGURATIONS FOR TWO PIPE VENTING SYSTEMS WHEN BOTH TERMINATIONS ARE LOCATED IN THE SAME PRESSURE ZONE

NOTE:
ELBOW AND TEE MUST BE AS CLOSE TOGETHER AS POSSIBLE

CAUTION
DO NOT Install return air through the side of furnace cabinet on horizontal applications.

HORIZONTAL VENTING THROUGH WALL
These furnaces may be installed as direct vent (as shipped) or as nondirect vent. Installation must conform to national, state, and local codes. The vent & inlet terminals must be located at least 12" minimum above normally expected snow accumulation level.
Avoid areas where staining or condensate drippage may be a problem.

Location of the vent/wind terminal should be chosen to meet the requirements of Figure 26 for either direct or non-direct vent applications.

**PITCH** – Venting through the wall must maintain 1/4" per foot pitched upward to insure that condensate drains back to the furnace.

**FLUE GAS DEGRADATION** – The moisture content of the flue gas may have a detrimental effect on some building materials. This can be avoided by using the roof or chimney venting option. When wall venting is used on any surface that can be affected by this moisture, it is recommended that a corrosion resistant shield (24 inches square) be used behind the vent terminal. This shield can be wood, plastic, sheet metal, etc. Also, silicone caulk all cracks, seams and joints within 3 feet of the vent terminal.

**COMBUSTIBLE MATERIAL WALL**

A minimum clearance of 1" to combustible materials must be maintained when using single wall stainless steel venting. See Figure 30.

**NONCOMBUSTIBLE MATERIAL WALL**

The hole through the wall must be large enough to maintain pitch of vent and properly seal. Use cement mortar seal on inside and outside of wall. See Figure 31.

Shield material to be a minimum of 24 gauge stainless or aluminized sheet metal. Minimum dimensions are 12" x 12". Shield must be fastened to both inside and outside of wall. Use screws or anchor type fasteners suited to the outside or inside wall surfaces.

For Canadian applications, horizontal vent termination kits must meet ULC-S636.

**SUPPORT HORIZONTAL PIPE EVERY 3’ 0” WITH THE FIRST SUPPORT AS CLOSE TO THE FURNACE AS POSSIBLE.**

Induced draft blower, housing, and furnace must not support the weight of the flue pipe.
NOTE: VENT AND INLET MUST BE SUPPORTED AT A MAXIMUM OF 3' INTERVALS

NOTE: ANY FITTINGS PASSING THROUGH AN UNHEATED SPACE MUST BE INSULATED.

**CAUTION**

The vent for this appliance shall not terminate

1. Over public walkways; or
2. Near soffit vents or crawl space vents or other areas where condensate or vapor could create a nuisance or hazard or cause property damage; or
3. Where condensate vapor could cause damage or could be detrimental to the operation of regulators, relief valves, or other equipment.

For Canadian applications, horizontal vent termination kits must meet ULC-S636.
VENTING THROUGH THE ROOF
When penetrating roof with a 2" PVC vent pipe, a 2" electrical conduit flashing may be used for a weather tight seal. Lubricate flexible seal on flashing before PVC pipe is pushed through the seal. (Field Supplied)

NOTE:
No vent cap as shown in Figure 35 is the preferred method for vertical vent termination in extremely cold climates. In extreme climate conditions, insulate the exposed pipe above the roof line with Armaflex type insulation.

VENTING ROUTED THROUGH A MASONRY CHIMNEY VENT FITTING MATERIAL – STAINLESS STEEL
Gas and liquid tight single wall metal vent fitting, designed for resistance to corrosive flue condensate such as Type 29-4C MUST be used throughout. These fittings and fitting accessories are to be supplied locally.

DIRECTION OF STAINLESS STEEL FITTING
All stainless steel fitting must be installed with male end towards the furnace. All horizontal stainless steel sections must be positioned with the seam on top. All long horizontal sections must be supported to prevent sagging.

All pipe joints must be fastened and sealed to prevent escape of combustion products into the building.

NOTE:
Both venting methods shown in Figure 39 & 41 must also have the combustion air inlet installed - meeting dimension requirements of Figure 35.
**CAUTION**

Do NOT run vent through chimney for wood burning or oil furnaces or incinerators. If remaining free area between single wall flue pipe and masonry chimney is to be used for another gas appliance venting area must be sufficient to vent that appliance and that appliance must be connected to chimney with separate entry openings.

**IMPORTANT** –
The single wall flue pipe joints must be sealed. The 90° elbow connection to vertical pipe must be sealed to prevent condensate leakage to base of masonry chimney.
**IMPORTANT:**

The Commonwealth of Massachusetts requires compliance with regulation 248 CMR 4.00 and 5.00 for installation of through – the – wall vented gas appliances as follows:

For all side wall horizontally vented gas fueled equipment installed in every dwelling, building or structure used in whole or in part for residential purposes, including those owned or operated by the Commonwealth and where the side wall exhaust vent termination is less than seven (7) feet above finished grade in the area of the venting, including but not limited to decks and porches, the following requirements shall be satisfied:

1. **INSTALLATION OF CARBON MONOXIDE DETECTORS.** At the time of installation of the side wall horizontal vented gas fueled equipment, the installing plumber or gasfitter shall observe that a hard wired carbon monoxide detector with an alarm and battery back-up is installed on the floor level where the gas equipment is to be installed. In addition, the installing plumber or gasfitter shall observe that a battery operated or hard wired carbon monoxide detector with an alarm is installed on each additional level of the dwelling, building or structure served by the side wall horizontal vented gas fueled equipment. It shall be the responsibility of the property owner to secure the services of qualified licensed professionals for the installation of hard wired carbon monoxide detectors
   a. In the event that the side wall horizontally vented gas fueled equipment is installed in a crawl space or an attic, the hard wired carbon monoxide detector with alarm and battery back-up may be installed on the next adjacent floor level.
   b. In the event that the requirements of this subdivision can not be met at the time of completion of installation, the owner shall have a period of thirty (30) days to comply with the above requirements; provided, however, that during said thirty (30) day period, a battery operated carbon monoxide detector with an alarm shall be installed.

2. **APPROVED CARBON MONOXIDE DETECTORS.** Each carbon monoxide detector as required in accordance with the above provisions shall comply with NFPA 720 and be ANSI/UL 2034 listed and IAS certified.

3. **SIGNAGE.** A metal or plastic identification plate shall be permanently mounted to the exterior of the building at a minimum height of eight (8) feet above grade directly in line with the exhaust vent terminal for the horizontally vented gas fueled heating appliance or equipment. The sign shall read, in print size no less than one-half (1/2) inch in size, “GAS VENT DIRECTLY BELOW. KEEP CLEAR OF ALL OBSTRUCTIONS”.

4. **INSPECTION.** The state or local gas inspector of the side wall horizontally vented gas fueled equipment shall not approve the installation unless, upon inspection, the inspector observes carbon monoxide detectors and signage installed in accordance with the provisions of 248 CMR 5.08(2)(a)1 through 4.

This appliance requires a special venting system. If BAYAIR30AVENTA or BAYVENT200B are used, a copy of the installation instructions for the kit shall remain with the appliance or equipment at the completion of installation. The venting system installation instructions can be obtained from the manufacturer by writing to the following address:

Trane
6200 Troup Highway
Tyler, TX 75707
Attention: Manager of Field Operations Excellence

For Canadian installations, if you used a ULC-S636 approved manufactured modular venting system, a copy of the manufacturer’s instructions should remain with the system. The installation instruction can be obtained from the vent termination manufacturer.
CAUTION

It is recommended that a drain pan be installed under the furnace to prevent property damage or personal injury from leaking condensate.

Upflow furnace - The connection tubing for left and right side drainage is shipped in the blower compartment. Install the connection tubing from the trap to the side of the unit and trim all excess tubing to avoid kinks.

Downflow furnace - Use RTV silicon sealant to connect the fitting to the trap for ease of removal when cleaning the trap.

For left side drain a 1/2” slip PVC fitting is needed. See Figure 48.

To change to a right side drain, remove the drain lines from the trap, rotate the trap 180° so it exits to the right, then reconnect the lines. Start with a 1/2” 90° CPVC street elbow connected to the trap using RTV silicon sealant. Run 1/2” CPVC pipe to a CPVC elbow. Remove the plug and run 1/2” CPVC pipe from the elbow out through the right side cutout. See Figure 49.
HORIZONTAL APPLICATIONS

Upflow and Downflow furnaces - All horizontal applications are left side only. It is always recommended that the auxiliary drain pan be installed under a horizontally installed evaporator and/or 95% gas furnace. Connect the auxiliary drain pan to a separate drain line (no trap is needed in this line).

The trap must be repositioned to the exterior of the cabinet. Remove the trap from its present location and reposition the trap outside of the unit, through the long circular hole, next to the secondary recuperated cell. Remove the larger drain line (from the secondary cell) and trim to fit between the secondary cell and the new trap location. On upflow units, plug the hole in the blower deck where the tube went through.

Remove the hose from the induced blower and reposition into the other drain tap of the inducer, which is located 90° clockwise around the inducer. Move the cap from that drain tap to the unused drain tap. On upflow units, plug the hole in the blower deck where the tube went through. On upflow units, this tube may need to be extended, using the tubing shipped with the furnace.

Connections must be made to an OPEN or VENTED DRAIN. Outdoor draining of the furnace and coil condensate is permissible if allowed by local codes. Caution should be taken to prevent drains from freezing or causing slippery conditions that could lead to personal injury. Excessive draining of condensate may cause saturated ground conditions that may result in damage to plants.
NOTE:
Use 1/2" or larger PVC or CPVC pipe and fittings as required for drain connections (fittings, pipe and solvent cement not provided).

NOTE:
A corrosion resistant condensate pump must be used if a pump is required for a specific drain system.

IMPORTANT:
The condensate drain should be installed with provisions to prevent winter freeze-up of the condensate drain line. Frozen condensate will block drains, resulting in furnace shutdown. If the drain line cannot be installed in a conditioned space, then UL listed heat tape should be applied as required to prevent freezing (per manufacturer’s instructions). The heat tape should be rated at 5 or 6 watts per foot at 120 volts. Self-regulating (preferred) or thermostatically controlled heat tape is required.

Evaporator and furnace condensate drain piping may be manifolded together as shown in Figure 51. A primary drain vent stack must be installed and terminated below the outlet of the secondary heat exchanger drain connection to prevent water from damaging furnace controls if the primary drain outlet plugs up. Where the furnace is installed above a finished ceiling, the primary drain vent stack must be installed such that overflow from the vent stack opening will flow into an auxiliary drain pan in order to prevent water damage to the finished ceiling below.

TWINNING FURNACES
These furnaces may be twinned. Twinning requires that two furnaces with the same configuration, capacity, and airflow must be used. They shall have common returns with equal pressure drops or ducts with equivalent lengths and sizes. See Field Wiring Diagrams for proper hookup.
**ELECTRICAL CONNECTIONS**

Make wiring connections to the unit as indicated on enclosed wiring diagram. As with all gas appliances using electrical power, this furnace shall be connected into a permanently live electric circuit. It is recommended that furnace be provided with a separate “circuit protection device” in the electric circuit. The furnace must be electrically grounded in accordance with local codes or in the absence of local codes with the National Electrical Code, ANSI/NFPA 70 or CSA C22.1 Electrical Code, if an external electrical source is utilized.

The integrated furnace control is polarity sensitive. The hot leg of the 120V power supply must be connected to the black power lead as indicated on the wiring diagram. Provision for hooking up an electronic air cleaner and or humidifier is provided on the integrated control.

Refer to the SERVICE FACTS literature and unit wiring diagram attached to furnace diagram attached to furnace.
TWINNING CONNECTION DIAGRAM
FOR TWINNING 1 STAGE FURNACES WITH SINGLE WIRE TWINNING FEATURE
1 STAGE HEATING ONLY THERMOSTAT

1. BOTH FURNACES MUST BE POWERED FROM THE SAME 120 V AC SUPPLY (3 Wire Circuit Panel).

2. INVERT 24V FURNACE TRANSFORMERS ARE PAIRS. PRIOR TO COMPLETING CONNECTIONS, CHECK VOLTAGE BETWEEN "R" "TWIN" NOTED ON EACH FURNACE. IF VOLTAGE IS GREATER THAN 24V, INSPECT FOR A SECONDARY LEAD OR ONE OF THE FURNACE TRANSFORMERS.

3. CONNECTION MAY BE REQUIRED FOR ELECTRONIC THERMOSTAT.

4. IF CURRENT EXCEEDS THERMOSTAT CURRENT RATING, SEE ISOLATION RELAYS (R1). AS SHOWN, DO NOT CONNECT W TO R1.

5. ISOLATION RELAY AND ISOLATION CONTACTS ARE RATED AT 1.0A OR ABOVE.

OUTDOOR UNIT
(WITH TRANSFORMER)

OUTDOOR UNIT
(NO TRANSFORMER)

1. BOTH FURNACES MUST BE POWERED FROM THE SAME 240 V AC SUPPLY (3 Wire Circuit Panel).

2. INSPECT 24V FURNACE TRANSFORMERS ARE PAIRS. PRIOR TO COMPLETING CONNECTIONS, CHECK VOLTAGE BETWEEN "R" "TWIN" NOTED ON EACH FURNACE. IF VOLTAGE IS GREATER THAN 24V, INSPECT FOR A SECONDARY LEAD OR ONE OF THE FURNACE TRANSFORMERS.

3. IF OUTDOOR UNIT HAS A 24V TRANSFORMER, AN EXTERNAL ISOLATION RELAY MUST BE INSTALLED (FIELD SUPPLIED). SEE ALSO NOTE 5.

4. IF CURRENT EXCEEDS THERMOSTAT CURRENT RATING, SEE ISOLATION RELAYS (R1). AS SHOWN, DO NOT CONNECT W TO R1.

5. ISOLATION RELAY AND ISOLATION CONTACTS ARE RATED AT 1.0A OR ABOVE.

INTER-COMPONENT WIRING

From Dwg. 21B341423 Rev. 2
GAS PIPING
The upflow/horizontal furnace is shipped standard for left side installation of gas piping. A cutout is provided on the right side for an alternate gas piping arrangement. See Figure 52.
The installation of piping shall be in accordance with piping codes and the regulations of the local gas company. Pipe joint compound must be resistant to the chemical reaction with liquefied petroleum gases.
Refer to piping Table 15, for delivery sizes. Connect gas supply to the unit, using a ground joint union and a manual shut-off valve as shown in Figures 52-53.
National codes require a condensation drip leg to be installed ahead of the controls as shown in Figures 52-53.
The furnace and its individual shut-off valve must be disconnected from the gas supply piping system during any pressure testing of that system at test pressures in excess of 1/2 psig (3.5 kPa).
The furnace must be isolated from the gas supply piping by closing its individual manual shut-off valve during any pressure testing of the gas supply piping system at test pressures equal to or less than 1/2 psig (3.5 kPa).

NOTE:
Maximum pressure to the gas valve for natural gas is 13.8" W.C. Minimum pressure is 5.0" W.C. Maximum pressure to the gas valve for propane is 13.8" W.C. Minimum pressure is 11.0" W.C.
All gas fittings must be checked for leaks using a soapy solution before lighting the furnace. DO NOT CHECK WITH AN OPEN FLAME!

CAUTION
Use a backup wrench on the gas valve when installing gas piping to prevent damage to the gas valve and manifold assembly.
4. Read the “Flow” column opposite the number of seconds clocked.
5. Use the following factors if necessary:
   For 1 Cu. Ft. Dial Gas Flow CFH =  
   Chart Flow Reading ÷2
   For 1/2 Cu Ft. Dial Gas Flow CFH =  
   Chart Flow Reading ÷4
   For 5 Cu. Ft. Dial Gas Flow CFH =  
   10X Chart Flow Reading ÷4
6. Multiply the final figure by the heating value of the gas obtained from the utility company and compare to the nameplate rating. This must not exceed the nameplate rating.

Gas Valve Adjustment
Changes can be made by adjusting the manifold pressure (See Table 17, or changing orifices (orifice change may not always be required). To adjust the manifold pressure:
1. Turn off all electrical power to the system.
2. Attach a manifold pressure gauge with flexible tubing to the outlet pressure boss marked “OUT P” on White-Rodgers gas valve model 36G or 36J. See Figure 58 for White-Rodgers gas valve model 36J. See Figure 57 for White-Rodgers gas valve model 36G.
3. Loosen (Do Not remove) the pressure tap test set screw one turn with 3/32” hex wrench.
   a. The pressure tap adjustment kit (KIT07611) contains a 3/32” hex wrench, a 5/16” hose and a connector and can be ordered through Global Parts.
4. Turn on system power and energize valve.
5. Adjust gas heat by removing the adjustment regulator cover screw.
   a. To increase outlet pressure, turn the regulator adjustment screw clockwise.
   b. To decrease outlet pressure, turn the regulator adjustment screw counterclockwise.
   c. Adjust regulator until pressure shown on manometer matches the pressure specified in Table 17.

1. The input of no more than nameplate rating and no less than 93% of the nameplate rating, unless the unit is derated for high altitude.
   d. Replace and tighten the regulator cover screw securely.

6. Cycle the valve several times to verify regulator settings.
   a. Repeat steps 5-6 if needed.

7. Turn off all electrical power to the system.

8. Remove the manometer and flexible tubing and tighten the pressure tap screw.

9. Using a leak detection solution or soap suds, check for leaks at the pressure outlet boss and pressure tap test screw.

10. Turn on system power and check operation of the unit.

NOTE:
The manifold pressure must be referenced to the burner box. The burner box pressure tap equalizes the gas valve pressure regulator. Manifold pressure is checked by installing a tee (field supplied) in the tubing, between the tee coming from the burner box tube and the gas valve, in addition to the regular gas valve pressure tap on the outlet side of the gas valve. See Figure 55.

CAUTION
Replace manifold pressure tap threaded plug and leak check after adjusting manifold gas pressure.

Table 19 lists the main burner orifices used with the furnace. If a change of orifices is required to correct the furnace input rating. Refer to Table 20.

SAFETY HAZARD
Replace and/or tighten all plugs removed or loosened when adjusting gas pressure. Leak check the fittings before placing the furnace into regular service. Failure to follow this warning could result in fire, explosion, or property damage.
HIGH ALTITUDE DERATE
Input ratings (BTUH) of these furnaces are based on sea level operation and should not be changed at elevations up to 2,000 ft.
If the installation is 2,000 ft. or above, the furnace input rate (BTUH) shall be reduced 4% for each 1,000 ft. above sea level. The furnace input rate shall be checked by clocking the gas flow rate (CFH) and multiplying by the heating value obtained from the local utility supplier for the gas being delivered at the installed altitude. Input rate changes can be made by adjusting the manifold pressure (min 3.0 - max 3.7 in. W.C. - Natural Gas for upflow models and min 3.0 - max 4.5 in. W.C. - Natural Gas for downflow models) or changing orifices (orifice change may not always be required). If the desired input rate can not be achieved with a change in manifold pressure, then the orifices must be changed. LP installations will require an orifice change.
Installation of this furnace at altitudes above 2,000 ft. (610m) shall be in accordance with the local codes, or in the absence of local codes, the National Fuel Gas Code, ANSI Z223.1/ NFPA 54 or National Standard of Canada, Natural Gas and Propane Installation Code, CSA 149.1. Installation of this furnace at altitudes above 2,000 ft. (610m) shall be made in accordance with the listed high Altitude Conversion Kit available with this furnace.

IMPORTANT:
Re-install the propane orifices to the same depth as the orifices supplied with the equipment.

See Table 19 & 20 for help in selecting orifices if orifice change is required. Furnace input rate and temperature rise should be checked again after changing orifices to confirm the proper rate for the altitude. Installations above 4,000 feet may require a pressure switch change. If required, use the BAYHALT*** Kit (High Altitude Accessory Kit) listed in PRODUCT DATA.

From National Fuel Gas Code - Table F-4

**Lighting Instructions**

Check all gas connections for leaks with a soapy solution — **DO NOT CHECK WITH AN OPEN FLAME**. Allow 5 minutes for any gas that might have escaped to dissipate. LP Gas being heavier than air may require forced ventilation. Flip the switch on the gas valve in the unit to the “ON” position.

**WARNING**

**Carbon Monoxide Poisoning Hazard**

Failure to follow the installation instructions for the venting system being placed into operation could result in carbon monoxide poisoning or death.

**Start Up and Adjustment**

**Preliminary Inspections**

With gas and electrical power “OFF”

1. Duct connections are properly sealed
2. Filters are in place
3. Venting is properly assembled
4. Blower door is in place

Flip the switch on main gas valve within the unit to the “OFF” position. Turn the external gas valve to “ON”. Purge the air from the gas lines. After purging,

**Lighting Instructions**

Safety hazard

Do **not** attempt to manually light the burner.

Failure to follow this warning could result in property damage, personal injury or death.

Lighting instructions appear on each unit. Each installation must be checked out at the time of initial start up to insure proper operation of all components. Check out should include putting the unit through one complete cycle as outlined below.

Turn on the main electrical supply and set the thermostat above the indicated temperature. The ignitor will automatically heat, then the gas valve is energized to permit the flow of gas to the burners. After ignition and flame is established, the flame control module monitors the flame and supplies power to the gas valve until the thermostat is satisfied.
Installer’s Guide

To shut off.
For complete shut-down: Flip the switch on the main gas valve to the “OFF” position, (See Figure 57 & 58). Disconnect the electrical supply to the unit.

⚠️ CAUTION
If this is done during the cold weather months, provisions must be taken to prevent freeze-up of all water pipes and water receptacles.
Failure to follow this warning could result in property damage.

Whenever your house is to be vacant, arrange to have someone inspect your house for proper temperature. This is very important during freezing weather. If for any reason your furnace should fail to operate damage could result, such as frozen water pipes.

SEQUENCE OF OPERATION
Thermostat call for heat
R and W thermostat contacts close signaling the control module to run its self-check routine. After the control module has verified that the pressure switch contacts are open and the limit switch(es) contacts are closed, the draft blower will be energized.

As the induced draft blower comes up to speed, the pressure switch contacts will close and the ignitor warm up period will begin. The ignitor will heat for approximately 20 seconds, then the gas valve is energized to permit gas flow to the burners. The flame sensor confirms that ignition has been achieved.

After the flame sensor confirms within a 4 second trial period that ignition has been achieved, the delay to fan ON period begins timing. After approximately 45 seconds the indoor blower motor will be energized and continue to run during the heating cycle (downflow models have a 10 second blower ON delay).

When the thermostat is satisfied, R and W thermostat contacts open, the gas valve will close, the flames will extinguish, and the induced draft blower will be de-energized.

The indoor blower motor will continue to run for the fan off period (Field selectable at 60, 100, 140 or 180 seconds), then be de-energized by the control module.

CONTROL AND SAFETY SWITCH ADJUSTMENTS
LIMIT SWITCH CHECK OUT
The limit switch is a safety device designed to close the gas valve should the furnace become overheated. Since proper operation of this switch is important to the safety of the unit, it must be checked out on initial start up by the installer.

To check for proper operation of the limit switches, set the thermostat to a temperature higher than the indicated temperature to bring on the gas valve. Restrict the airflow by blocking the return air (disconnecting the indoor blower may trip the inducer limit).

When the furnace reaches the maximum outlet temperature as shown on the rating plate, the burners must shut off. If they do not shut off after a reasonable time and overheating is evident, a faulty limit switch is probable and the limit switch must be replaced. After checking the operation of the limit control, be sure to remove the paper or cardboard from the return air inlet. Refer to Service Facts for additional instructions.

NOTE TO INSTALLER
Review the following warnings with the owner. Review contents of USER’S INFORMATION MANUAL with the owner.

AIRFLOW ADJUSTMENT
Check inlet and outlet air temperatures to make sure they are within the ranges specified on the furnace rating nameplate. If the airflow needs to be increased or decreased, see the wiring diagram for information on changing the speed of the blower motor.

⚠️ WARNING
ELECTRICAL SHOCK HAZARD
Disconnect power to the unit before removing the blower door.
Failure to follow this warning could result in property damage, personal injury or death.

This unit is equipped with a blower door switch which cuts power to the blower and gas valve causing shutdown when the door is removed. Operation with the door removed or ajar can permit the escape of dangerous fumes. All panels must be securely closed at all times for safe operation of the furnace.

INDOOR BLOWER TIMING
Heating: The integrated furnace control module controls the indoor blower. The blower start is fixed at 45 seconds after ignition (10 seconds for downflow models). The FAN-OFF period is field selectable by dip switches at 60, 100, 140, or 180 seconds. The factory setting is 100 seconds (See wiring diagram).

Cooling: The delay off period is factory set at 0 seconds. The option for 80 second delay off is field selectable (See wiring diagram).

ROOM AIR THERMOSTAT
HEAT ANTICIPATOR ADJUSTMENT
Set the thermostat heat anticipator according to the current flow measured, or the settings found in the notes on the furnace wiring diagram (found in the SERVICE FACTS or inside the furnace casing).

INSTRUCTIONS TO THE OWNERS

EXPLOSION HAZARD
In the event that electrical, fuel, or mechanical failures occur, shut off the gas supply off at the manual gas valve, located on the supply gas piping coming into the furnace, before turning off the electrical power to the furnace. Contact the service agency designated by your dealer.

BURNER BOX TEMPERATURE LIMIT DEVICE
All models are equipped with a manual reset temperature limit located on the burner box. In case of excessive temperature, the limit will open and cause the circuit to open which shuts off all flow of gas.
ABNORMAL CONDITIONS
1. EXCESSIVE COMBUSTION PRESSURE (WIND IN EXCESS OF 40 M.P.H.) VENT OR FLUE BLOCKAGE
   If pressure against induced draft blower outlet becomes excessive, the pressure switch will open and shut off the gas valve until acceptable combustion pressure is again available.
2. LOSS OF FLAME
   If loss of flame occurs during a heating cycle, or flame is not present at the sensor, the flame control module will close the gas valve. The flame control module will then recycle the ignition sequence, then if ignition is not achieved, it will shut off the gas valve and lock out the system.
3. POWER FAILURE
   If there is a power failure during a heating cycle, the system will restart the ignition sequence automatically when power is restored if the thermostat still calls for heat.
4. GAS SUPPLY FAILURE
   If loss of flame occurs during a heating cycle, the system integrated control module will recycle the ignition sequence, then if ignition is not achieved, the integrated control module will shut off the gas valve and lock out the system.
5. INDUCED DRAFT BLOWER FAILURE
   If pressure is not sensed by the pressure switch, the contacts will remain open and not allow the gas valve to open, therefore the unit will not start. If failure occurs during a running cycle, the pressure switch contacts will open and the gas valve will close to shut the unit down.
6. CONDENSATE DRAIN BLOCKAGE
   If the condensate drain is blocked, either by debris, improper draining, or by freezing condensate, the pressure switch will receive a signal warning of the accumulation of condensate in the heat exchanger assembly. The pressure switch contacts will open and remain open, not allowing unit operation. The unit will not operate until the condensate drain has been cleared, and the condensate flows freely.
7. RESET AFTER LOCKOUT
   When the integrated control module has shut the system down and gone into lockout, the system must be manually reset before the unit will restart. To reset, turn the system power off, then on, then off and then on again within 30 seconds. This may be done at the unit’s power source or at the thermostat. The system will not reset unless the procedure off-on-off-on is completed within 30 seconds.
8. RESET AFTER BURNER BOX LIMIT SHUTDOWN
   If the furnace shuts down, one thing that can be checked is the burner box temperature limit switch. It is located on the bottom of the burner box. The vent and combustion air inlet terminations should be checked for blockage. If blockage exists, clear the problem and then the reset button may be depressed. If there is no blockage of the terminations, the limit switch must be reset by a qualified servicer.

Carbon monoxide, fire or smoke can cause serious bodily injury, death, and/or property damage. A variety of potential sources of carbon monoxide can be found in a building or dwelling such as gas-fired clothes dryers, gas cooking stoves, water heaters, furnaces and fireplaces. The U.S. Consumer Product Safety Commission recommends that users of gas-burning appliances install carbon monoxide detectors as well as fire and smoke detectors per the manufacturer's installation instructions to help alert dwelling occupants of the presence of fire, smoke or unsafe levels of carbon monoxide. These devices should be listed by Underwriters Laboratories, Inc. Standards for Single and Multiple Station Carbon Monoxide Alarms, UL 2034 or CSA International Standard, Residential Carbon Monoxide Alarming Devices, CSA 6.19

NOTE: The manufacturer of your furnace does not test any detectors and makes no representations regarding any brand or type of detector.
WARNING: This product contains fiberglass wool insulation! Fiberglass dust and ceramic fibers are believed by the State of California to cause cancer through inhalation. Glasswool fibers may also cause respiratory, skin, or eye irritation.

PRECAUTIONARY MEASURES:

- Avoid breathing fiberglass dust.
- Use a NIOSH approved dust/mist respirator.
- Avoid contact with the skin or eyes. Wear long-sleeved, loose-fitting clothing, gloves, and eye protection.
- Wash clothes separately from other clothing; rinse washer thoroughly.
- Operations such as sawing, blowing, tear-out, and spraying may generate fiber concentrations requiring additional respiratory protection. Use the appropriate NIOSH approved respirator in these situations.

FIRST AID MEASURES:

Eye Contact - Flush eyes with water to remove dust. If symptoms persist, seek medical attention.

Skin Contact - Wash affected areas gently with soap and warm water after handling.
