

Indoor Air Quality Assessment

TRANE[®]

A fresh take on your indoor air quality— from the industry expert

K-12 school administrators, your staff, your students, and your buildings have been through a lot of challenges this year. From extended shutdowns to cancellation of sports and extra-curricular activities to fast-tracked remote learning programs, the challenges have been vast. The prospect of reopening schools this fall presents many more, chief among them ensuring the comfort of all your students and staff in the building.

With public concerns about reopening schools, along with ever-evolving buildings standards and guidance, it has never been more important to address your school's indoor air quality (IAQ). Trane can help. You can count on our expertise, tools and insights to help ensure that when your doors open this fall, you'll be ready. Indoor air quality will be in line with new industry guidelines, and HVAC systems will be working optimally.

The Trane IAQ Assessment is a science-based, fact-driven analysis of your school's air quality. It focuses on the four key drivers of IAQ: building ventilation, humidity control, filtration and clean air. Using real-time data about your facility's IAQ, Trane experts will help you:

- Understand and act on current industry guidelines and recommendations
- Identify strategic opportunities to make improvements
- Implement changes through strategic collaboration

Simplify your procurement. The entire portfolio of Trane products and services is included in our contract through Kinetic GPO.
